Columbus, OH 43229-1111

PREFACE

This volume of the annual hydrologic data report of Ohio is one of a series of annual reports that document hydrologic data gathered from the U.S. Geological Survey's surface- and ground-water data-collection networks in each State, Puerto Rico, and Trust Territories. These records of streamflow, ground-water levels, and quality of water provide the hydrologic information needed by State, local, and Federal agencies and the private sector for developing and managing our Nation's land and water resources. Hydrologic data for Ohio are contained in two volumes:

- Volume 1. Ohio River Basin Excluding Project Data
- Volume 2. St. Lawrence River Basin and Statewide Project Data

This report is the culmination of a concerted effort by dedicated personnel of the U.S. Geological Survey who collected, compiled, analyzed, verified, and organized the data, and who typed, edited, and assembled the report. In addition to the authors, who had primary responsibility for assuring that the information contained herein is accurate, complete, and adheres to Geological Survey policy and established guidelines, the following individuals contributed significantly to the collection, processing, and tabulation of the data:

| 13. ABSTRACT (Maximum 200 words) Water-resources data for the 2000 water year for Ohio consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water quality of ground-water wells. This report, in two volumes, contains records for water discharge at 122 gaging stations and 65 partial-record sites; water levels at 65 observation wells and 23 crest-stage gages; and water quality at 36 gaging stations, 69 observation wells, and 35 partial-record sites. Also included are data from miscellaneous and synoptic sites. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Information System collected by the U.S. Geological Survey and cooperating Federal, State, and local agencies in Ohio. | | | |

Discontinued Surface-Water-Discharge Stations

The following continuous-record surface-water-discharge or stage-only stations (gaging stations) have been discontinued. Daily discharge or stage records were collected and published for the period of record, expressed in water years, shown for each station. Discontinued project stations with less than 3 years of record have not been included. Information regarding these stations may be obtained from the District Office at the address given on the back side of the title page of this report.

[mi², square miles; a---, not determined for canals.]

| Station name | Station number | Drainage area (mi²) | Period of record |
|---|-----------------------|---|-------------------------|
| St. Joseph River near Blakeslee | 04177500 | 394 | 1926-32 |
| St. Marys River near Willshire | 04181000 | 354 | 1926-32 |

Discontinued Surface-Water-Quality Stations

The following continuous-record surface-water-quality stations have been discontinued. Daily records of temperature, specific conductance, pH, dissolved oxygen, or sediment were collected and published for the period of record, expressed in water years, shown for each station. Discontinued project stations with less than 3 years of record have not been included. Information regarding these stations may be obtained from the District Office at the address given on the back side of the title page of this report.

[mi², square miles; letters designate type of record: do, dissolved oxygen; pH, pH; s, sediment; sc, specific conductance; t, temperature]

| Station name | Station number | Drainage area (mi ²) | Type of record | Period of record |
|---|----------------|----------------------------------|--------------------|-------------------------------|

INTRODUCTION

The Water Resources Division of the U.S. Geological Survey (USGS), in cooperation with state agencies, obtains a large amount of data each water year (a water year is the 12-month period from October 1 through September 30 and is identified by the calendar year in which it ends) pertaining to the water resources of Ohio. These data, accumulated during many years, constitute a valuable data base for developing an improved understanding of the water resources of the State. To make these data readily available to interested parties outside the USGS, they are published annually in this report series entitled "Water Resources Data—Ohio."

This report (in two volumes) includes records on surface water and ground water in the State. Specifically, it contains (1) discharge records for streamflow-gaging stations, miscellaneous sites, and crest-stage stations, (2) stage and content records for streams, lakes, and reservoirs, (3) water-quality data for streamflow-gaging stations, wells, synoptic sites, and partial-record sites, and (4) water-level data for observation wells. Locations of lake- and streamflow-gaging stations, water-quality stations, and observation wells for which data are presented in this volume are shown in figures 1a through 1d. The data in this report represent that part of the National Water Information System collected by the USGS and cooperating State and Federal agencies in Ohio.

This series of annual reports for Ohio began with the 1961 water year with a report that contained only data relating to the quantities of surface water. For the 1964 water year, a similar report was introduced that contained only data relating to water quality. Beginning with the 1975 water year, the report was changed to present (in two to three volumes) data on quantities of surface water, quality of surface and ground water, and ground-water levels.

Prior to the introduction of this series, and for several years concurrent with it, water-resources data for Ohio were published in a series of USGS Water-Supply Papers. Data on stream discharge and stage and on lake or reservoir contents and stage through September 1960 were published annually under the title "Surface-Water Supply of the United States, Parts 3 and 4." For the 1961 through 1970 water years, the data were published in two 5-year reports. Data on chemical quality, temperature, and suspended sediment for the 1941 through 1970 water years were published annually under the title "Quality of Surface Waters of the United States," and ground-water levels for the 1935 through 1974 water years were published under the title "Ground-Water Levels in the United States." The above-mentioned Water-Supply Papers can be found in libraries of the principal cities of the United States and can be purchased from the U.S. Geological Survey, Information Services, Box 25286, Denver, CO 80225.

Publications similar to this report are published annually by the USGS for all states. These official USGS reports are identified by means of a number consisting of the two-letter state abbreviation, the last two digits of the water year, and the volume number. For example, this volume is identified as "U.S. Geological Survey Water-Data Report OH-00-2." For archiving and general distribution, the reports for 1971-74 water years are also identified as water-data reports. These water-data reports can be purchased in paper copy or in microfiche from the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22161.

USGS water data can be accessed on the World Wide Web at <http://water.usgs.gov>. Data at this Web site include historical daily values and peaks, real-time water data, and spatial data. (The USGS Ohio District's Web site can be accessed at <http://oh.water.usgs.gov>).

Additional information for ordering specific reports, including current prices, may be obtained by writing the District Chief at the address given on the back of title page or by telephoning (614) 430-7700.

COOPERATION

The USGS has had cooperative agreements for the collection of water-resources data since 1898. The following organizations assisted in collecting data in this report:

Cities of Akron, Canton, Cincinnati, Columbus (Water Division and Sewerage & Drainage Division), Cuyahoga Falls, Fremont, Warren, and Westerville
Counties of Clermont, Cuyahoga (Board of Health and Sanitary Engineering Division), Geauga, Knox Madison, Ross, and Summit
Cuyahoga River Community Planning Organization
Eastgate Development and Transportation Agency
Federal Emergency Management Agency, Region V
Miami Conservancy District
Northeast Ohio Regional Sewer District
Ohio Departments of Environmental Protection, Natural Resources (Minerals Management and Water Divisions), and Transportation
Ohio Mine Lands Partnership
Ottawa River Coalition
State of Ohio Adjutant General's Department
Village of South Russell
U.S. Air Force, Air Force Materiel Command, Aeronautical Systems Center, Environmental Management Directorate, Restoration Branch
U.S. Army Corps of Engineers (Buffalo, Huntington, Louisville, and Pittsburgh Districts, and Industrial Operations)
U.S. Environmental Protection Agency (NERL-MICROBIAL and Chemical Exposure Assessment Research Division, and Superfund Division, Region V)
Universities of Toledo and West Virginia

SUMMARY OF HYDROLOGIC CONDITIONS

Ohio is part of three physiographic provinces. Each province has its own distinctive hydrologic characteristics. The topography of the Till Plains Section of the Central Lowlands Physiographic Province (fig. 2) consists of gently rolling ground moraine, bands of terminal moraine, and outwash-filled valleys. Glaciation altered the courses of most streams in this area. The Eastern Lake Section (fig. 2) consists of wide expanses of level or nearly level land interrupted only by the sporadic sandy ridges that are the last visible remnants of glacial-lake beaches. Much of the area was swamp prior to development, and marshes are still present along Lake Erie near Toledo. The Lexington Plain Section of the Interior Low Plateaus Province (fig. 2) is characterized by rolling terrain and a few isolated large hills and ridges. The “barbed” drainage pattern formed when small streams were captured as their headwaters cut back into the hills over time. Streams have carved the Kanawha Section of the Appalachian Plateaus Province (fig. 2) into an intricate series of hollows and steep-sided ridges. Only the large streams in the section have any appreciable flood plain. In the southern New York Section (fig. 2), successive waves of glaciation have subdued the relief, buried many preglacial valleys, and rerouted many streams.

Precipitation

The average annual precipitation in Ohio is about 38 inches. The annual precipitation decreases from around 42 inches on the southern border to about 32 inches in the northwest. An anomalous area of high precipitation (as much as 44 inches) in northeastern Ohio results from air masses that pick up moisture and heat from Lake Erie and subsequently release precipitation over a range of hills stretching northeastward from Cleveland.

Monthly precipitation typically is greatest from May through July and least in October, December, and February. Of the approximate 38 inches of average annual precipitation, about 10 inches runs off immediately, 2 inches is retained at or near the surface and evaporates and transpires, and 26 inches enters the ground. Of the 26 inches that enters the ground, 20 inches is retained in the unsaturated zone and is later lost by evapotranspiration.

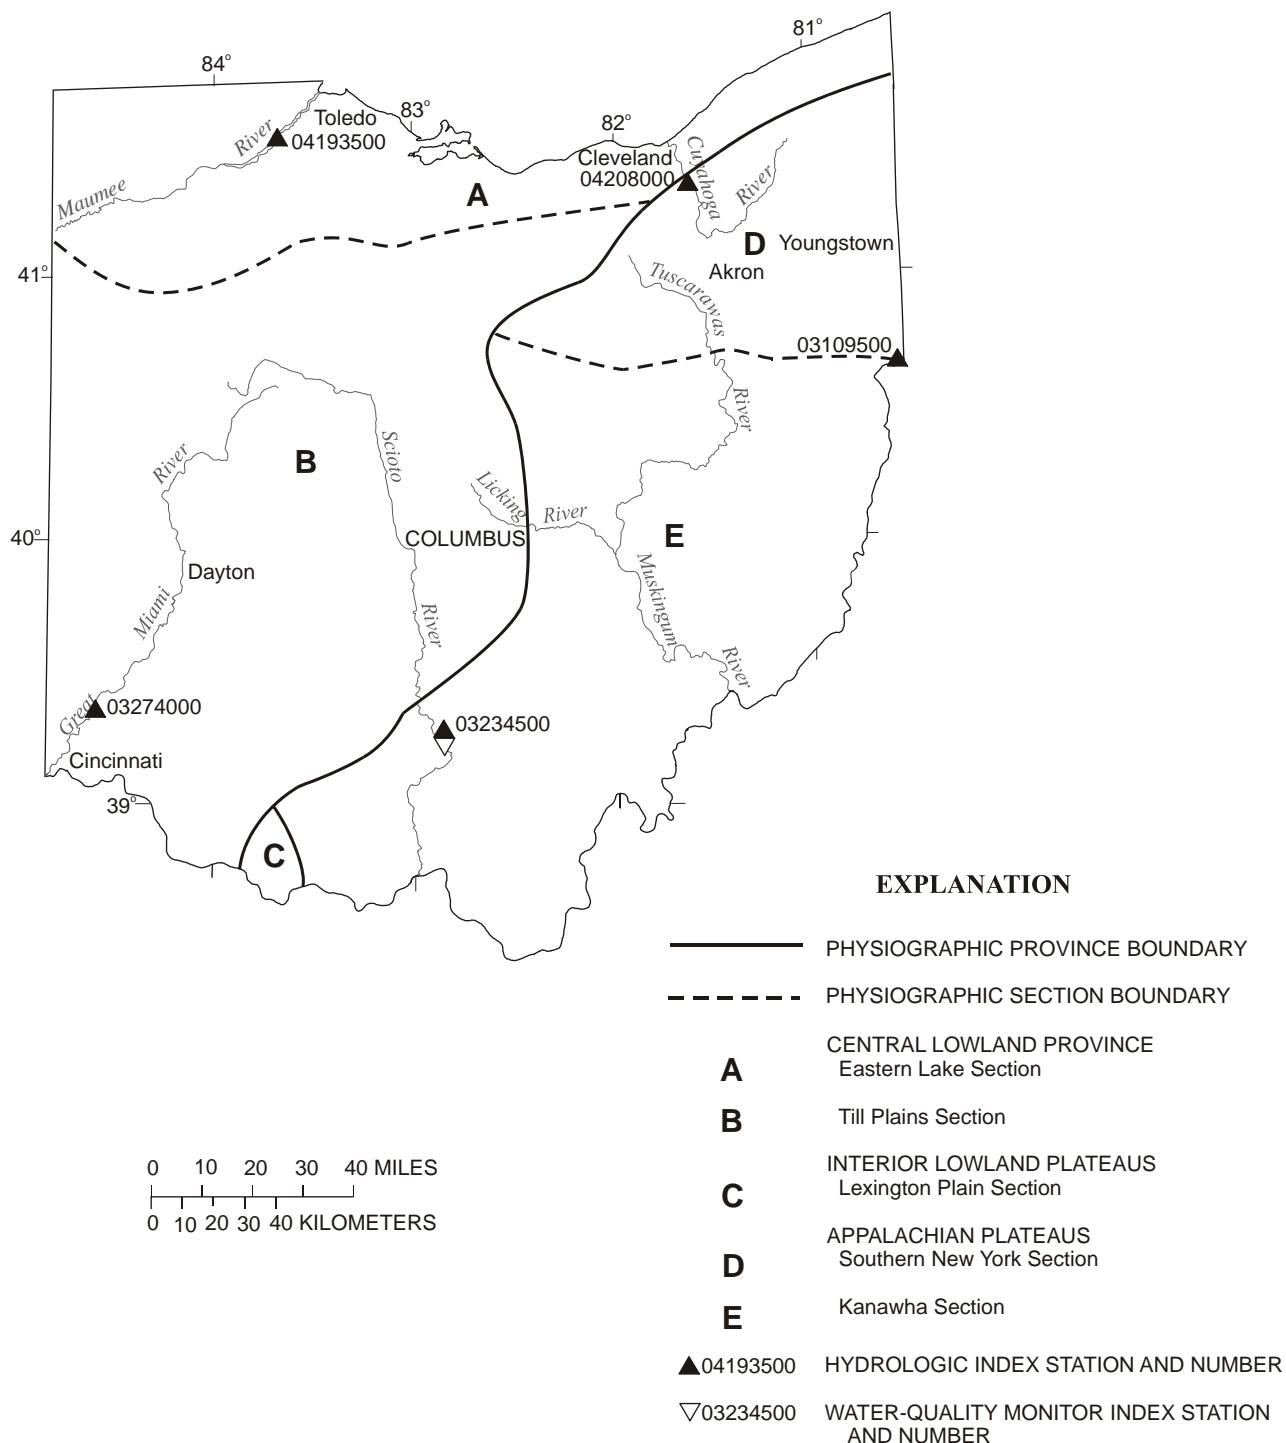

Figure 2. Physiographic divisions and location of hydrologic index stations.

The remaining 6 inches reaches the water table. Of this 6 inches, 2 inches eventually discharges to streams, and the rest is lost by evapotranspiration and consumptive use. Average runoff ranges from about 15 to 18 inches along the southern border to about 8 to 12 inches along most of the northern border, except in the northeast, where runoff is as much as 20 inches. The pattern of streamflow differs from the pattern of precipitation because of the contributions of snowmelt to streamflow in the early spring and the reduction in flows by evapotranspiration from June through September.

Surface Water

Streamflow

Streamflow-data-collection stations are distributed irregularly throughout the State and tend to be concentrated on the main river systems. The stations are used to sample a wide variety of conditions. The drainage areas range from less than 4 to 6,330 square miles and represent a wide diversity of topography and other physical characteristics. Streamflow ranges from unregulated to highly regulated.

Statewide Streamflow, Water Year 2000. At the beginning of water year 2000, streamflow was in the below normal* range for much of the State. Deficient flows prevailed in response to below-normal precipitation for the period October to December except for northeast Ohio, where streamflow was in the normal range. By January, flows were generally deficient in western Ohio and normal in eastern Ohio.

Above-normal precipitation in February caused flow to rise into the normal range except in south-central Ohio, where flow was excessive. Flooding occurred on small streams in southern Ohio in mid-February. The flooding caused some loss of life and property damage.

In March, streamflow fell into the normal range in south-central Ohio in response to below-normal precipitation. Streamflow fell into the deficient range for the rest of the State.

Near-normal precipitation prevailed in April and May, and streamflow was generally in the normal range for most of the State.

Excessive flows in northwest Ohio and normal flows elsewhere occurred for the remainder of the water year in response to normal to above-normal precipitation.

A comparison of streamflows for 2000 with long-term median flows at four representative stations is shown in figure 3.

Water Quality

The only active long-term monitoring program in Ohio is the National Water-Quality Assessment (NAWQA) Program, a program designed to assess the status and trends in the quality of ground- and surface-water resources in major hydrologic systems (study units) of the United States. The National Stream Quality Accounting Network (NASQAN) and the Hydrologic Benchmark Network (BENCHMARK) are other long-term national water-quality programs; however, work in Ohio on NASQAN and BENCHMARK were discontinued in 1996 and 1998, respectively. Sampling in NAWQA began in 1991 in the Nation and in 1996 at some sites in Ohio as part of the Lake Erie-Lake St. Clair (LERI) study unit. Sampling began in 1999 at some sites as part of the Great Miami and Little Miami River Basins (MIAM) NAWQA study unit. During water year 2000, the LERI NAWQA was in its low-intensity data-collection phase; therefore, water-quality data were collected at only one fixed station, the Maumee River at Waterville. During water year 2000, the MIAM NAWQA was in its high-intensity data-collection phase and collected water-quality data at eight fixed sites, one of which was the Mad River at St. Paris Pike near

* For streamflow, "normal" is defined as being between the 25th and 75th percentiles as measured during the base period, water years 1961-90.

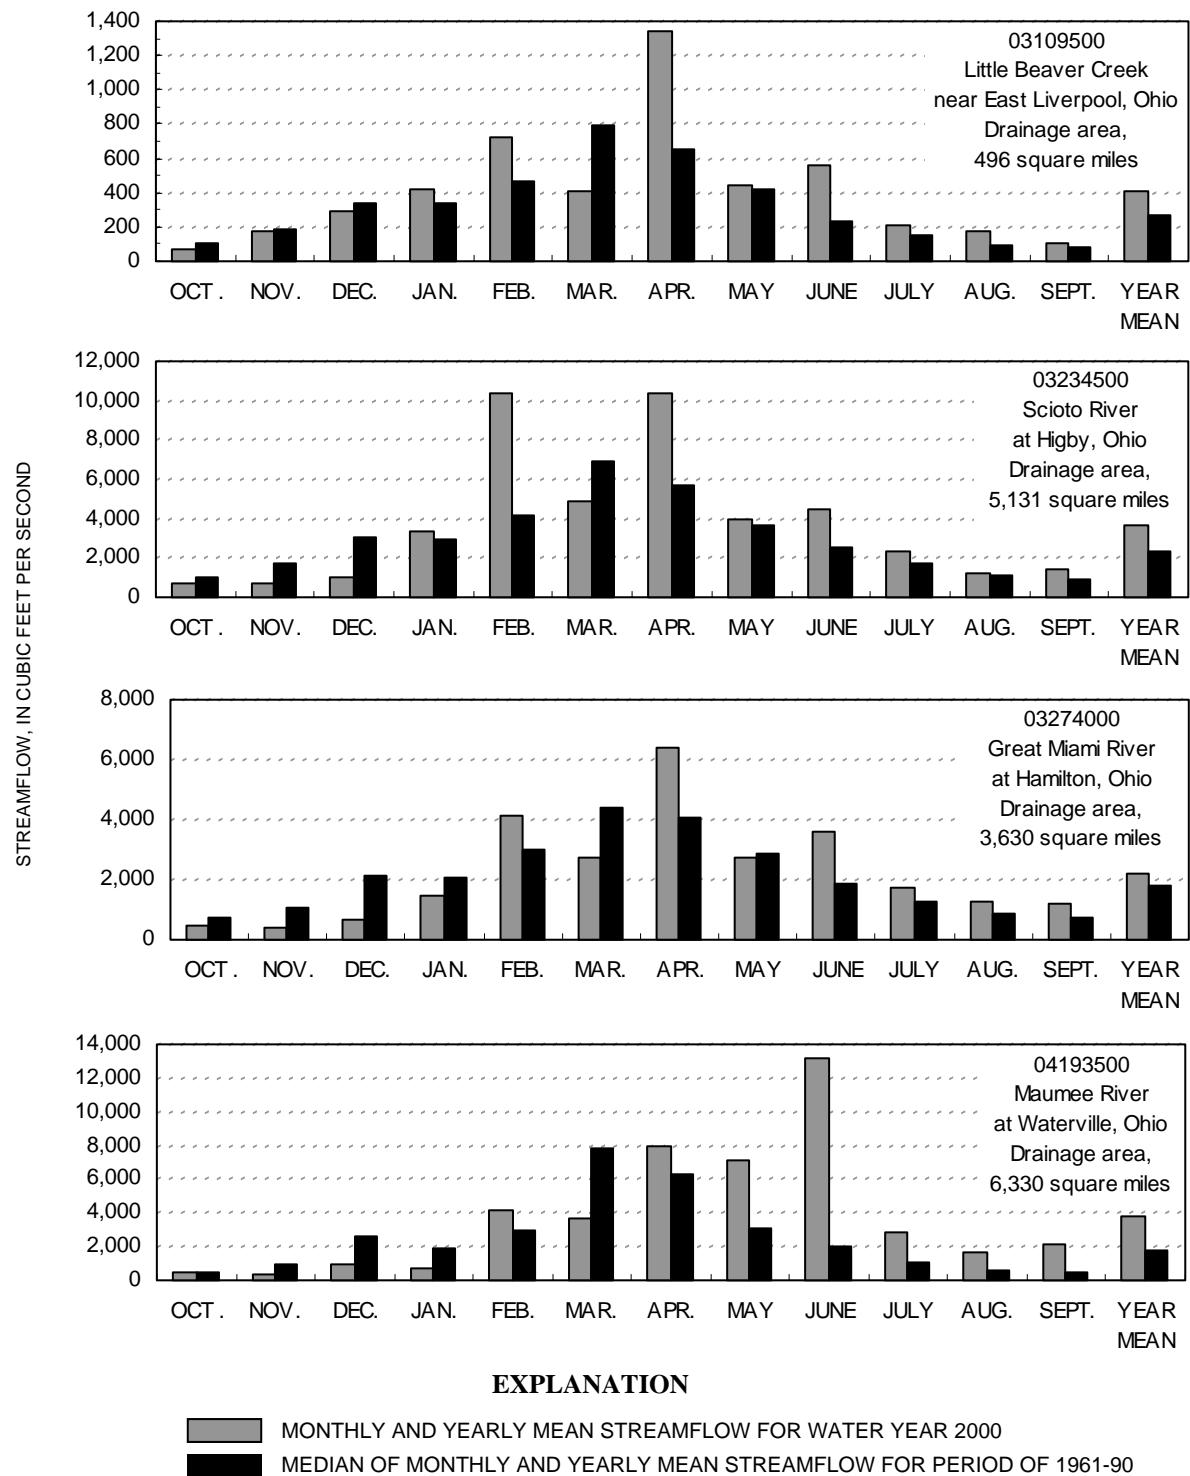

Figure 3. Streamflow during water year 2000 compared with median streamflow for period 1961-90 for four representative gaging stations.

Eagle City, Ohio. Whereas water-quality sampling in the NASQAN program was done quarterly, sampling in the NAWQA program is done much more frequently. For example, during water year 2000, 14 samples were collected at the Maumee River at Waterville and 21 samples were collected at the Mad River at St. Paris Pike. Samples for NAWQA were collected over a range of streamflows and were analyzed for major anions and cations, nutrients, pesticides, suspended sediment, selected physical properties, and *Escherichia coli*.

None of the samples collected during water year 2000 for nitrate plus nitrite concentrations at the Maumee River at Waterville or the Mad River at St. Paris Pike exceeded the U.S. Environmental Protection Agency maximum contaminant level for finished drinking water (10 milligrams per liter, as N). In Ohio, fertilizers are a major source of nitrate. Land use in the Maumee River Basin is mixed and consists of row-crop agriculture upstream and urban and industrial areas downstream. Concentrations of nitrate plus nitrite in the Maumee River in water year 2000 ranged from 0.31 to 10 milligrams per liter (mg/L) with a median concentration of 6.6 mg/L. At the Mad River site, which is in a predominantly agricultural area, concentrations of nitrate plus nitrite ranged from 1.4 to 6.5 mg/L, with a median concentration of 3.9 mg/L.

Agricultural runoff and municipal and industrial point sources are the principal sources of phosphorus in Ohio. Increased phosphorus concentrations may lead to a high rate of production of plant materials in water and eutrophication of the receiving water. During water year 2000, median concentrations of total phosphorus were 0.143 mg/L for the Maumee River and 0.068 mg/L for the Mad River. Only one sample had an extreme total phosphorus concentration of greater than 1 mg/L; this sample was collected from the Mad River during a January runoff event.

The Maumee and Mad Rivers are in areas of heavy herbicide use. Not surprisingly, herbicides were frequently detected in water samples collected during water year 2000. For example, atrazine and metolachlor were detected in 100 percent of the water samples collected from the Maumee River and 95 percent of those from the Mad River. Simazine was detected in 100 percent and 65 percent of samples from the Maumee and Mad Rivers, respectively. Acetochlor was detected less frequently—in 79 percent of the samples from the Maumee River and only 25 percent of the samples from the Mad River. Atrazine and simazine concentrations in two samples collected from the Maumee River exceeded the U.S. Environmental Protection Agency's Maximum Contaminant Levels (MCLs) (0.003 mg/L and 0.004 mg/L, respectively); MCLs have not been developed for acetochlor and metolachlor. No MCL exceedances were found in Mad River samples. The highest concentration found among these four herbicides during water year 2000 was 0.0082 mg/L in the Maumee River.

Escherichia coli (*E. coli*) is a bacterial indicator of fecal contamination of water and is the preferred and most useful indicator of the quality of recreational freshwater for body contact. *Escherichia coli* concentrations in the Maumee River ranged from 500 to 1,100 colonies per 100 milliliters (col/100 mL) and for the Mad River ranged from 20 to 10,600 col/100 mL. The single-sample standard for primary-contact recreation (suitable for full-body contact, such as swimming and canoeing) in Ohio is 298 col/100 mL. Fifty percent of the samples collected from the Maumee River and 41 percent from the Mad River met the primary-contact standard. Fecal contamination of waters can come from a variety of point and nonpoint sources including sewage-treatment plants; septic tanks; overflows from sanitary, combined, and storm sewers; feedlots; animal-production facilities; agricultural lands receiving manure applications; and pasture lands.

Ground Water

Ground water serves the needs of 46 percent of Ohio's population. An estimated 800 million gallons of ground water per day is withdrawn for public-supply, domestic, industrial, and agricultural purposes. Many people in Ohio depend on ground water as the only practical source of supply.

Ohio's unconsolidated aquifers are composed of either coarse- or fine-grained sediments. Both types are composed mainly of materials of glacial origin. The coarse-grained unconsolidated aquifers generally consist of highly permeable sand and gravel. Much of the sand and gravel is alluvium derived from glaciofluvial outwash

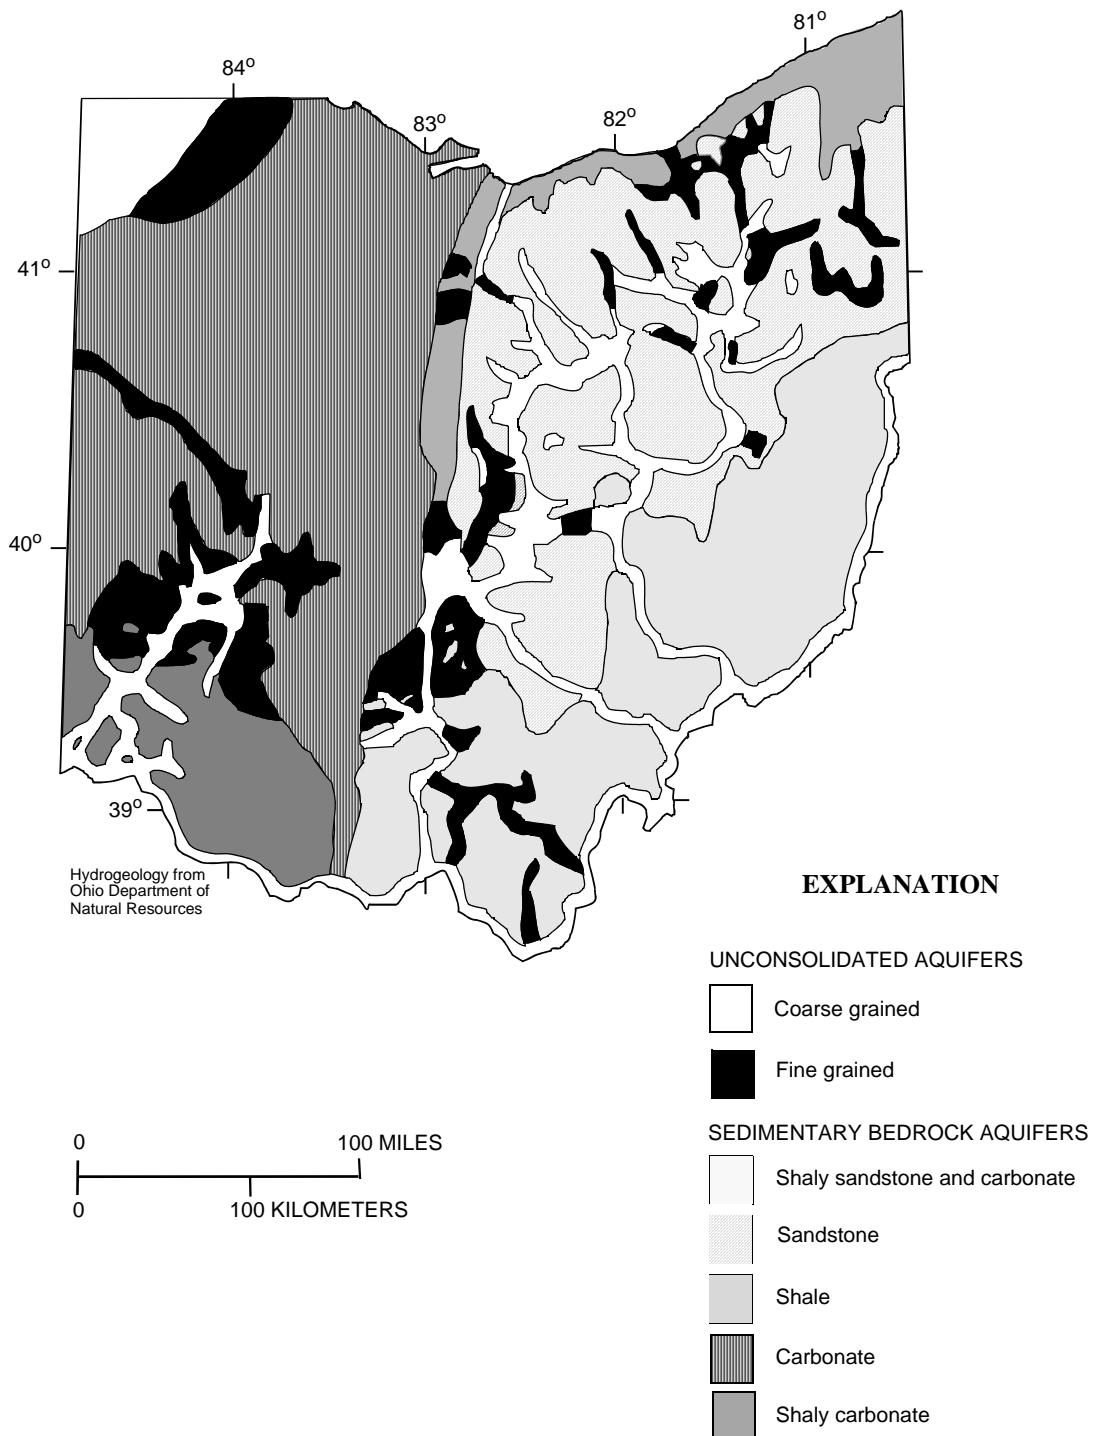

Figure 4. Geographic distribution of principal aquifers in Ohio.

along the courses of some modern streams; thus, these aquifers sometimes are referred to as “watercourse” aquifers. Coarse-grained unconsolidated aquifers in the northwestern corner of the State (fig. 4) underlie glacial till, are locally confined under artesian pressure, and are highly productive. Extensive kame-terrace deposits of water-bearing gravel and sand are widely used ground-water sources in northeastern Ohio. The fine-grained unconsolidated aquifers are similar to the coarse-grained unconsolidated aquifers in form and origin but are less permeable because of higher percentages of mixed fine sand, silt, and clay. Included in the fine-grained unconsolidated aquifers are tills that contain thin or localized stratified lenses of sand and gravel.

Ground-water supply for much of the unglaciated upland area of southeastern Ohio is from bedrock aquifers composed of shaly sandstone and thin limestone. These strata, which range from Mississippian to Permian in age, are dominated by low-yielding shales and shaly sandstones that include numerous coal-bearing strata. In some places, small water supplies are available from fractured coal beds. Several sandstone aquifers in northeastern Ohio are of regional extent and are major ground-water sources for individual and small public supplies. These include the Berea and Black Hand Sandstones of Mississippian age and several sandstone members of the Pottsville and Allegheny Formations of Pennsylvanian age. The Lake Erie coastline of northeastern Ohio is underlain by shale of Devonian and Mississippian age (fig. 4) that yields only small amounts of water to wells. Silurian-age limestone and dolomite and Devonian limestone comprise the carbonate aquifer system (fig. 4) of much of western Ohio. Glacial cover is uneven and consists of valley fill and terminal moraine in some places. The northeastern part of western Ohio contains an area of high-yielding wells that tap a preferentially weathered zone, which developed when carbonate section was periodically exposed as land mass during the Paleozoic Era. The southwestern corner of Ohio near Cincinnati is underlain by shale and a thin limestone aquifer of Ordovician age. Away from the watercourse (coarse unconsolidated) aquifers that traverse the area, the rocks that form the uplands yield only very small amounts of ground water.

Ground-Water Levels

Most ground-water observation wells in Ohio tap unconsolidated sand and gravel aquifers associated with the State's principal streams. Sample 1-year and 5-year hydrographs of a well completed in an unconfined unconsolidated sand-and-gravel aquifer are shown in figure 5. The observation-well network also includes some bedrock wells in areas where consolidated aquifers are heavily used for water supply, such as in the carbonate-rock region of northwestern Ohio. Sample 1-year and 5-year hydrographs of a well completed in a confined carbonate-rock aquifer are shown in figure 6. The yearly low for most wells occurs during the winter months, especially in cold, dry years or near the end of the growing season. Highs for the year usually occur from March through June, which is the peak of the recharge season. The yearly water-level fluctuation due to climatic conditions in water-table and confined-aquifer wells is commonly 3 to 5 feet but can be as much as 10 feet.

At the beginning of water year 2000, ground-water levels were below normal* for most of the State. Levels declined in October and November and remained below normal, with monthly record lows established at some wells.

In December and January, ground-water levels stabilized in response to near-normal precipitation but remained below normal throughout the State. Ground-water levels rose during February through April but levels continued to be below normal statewide.

The remainder of the water year was characterized by seasonal ground-water-level declines. Levels were generally below normal statewide from May through September.

* For ground-water, “normal” is defined as being between the 25th and 75th percentiles of the range values recorded during the reference period.

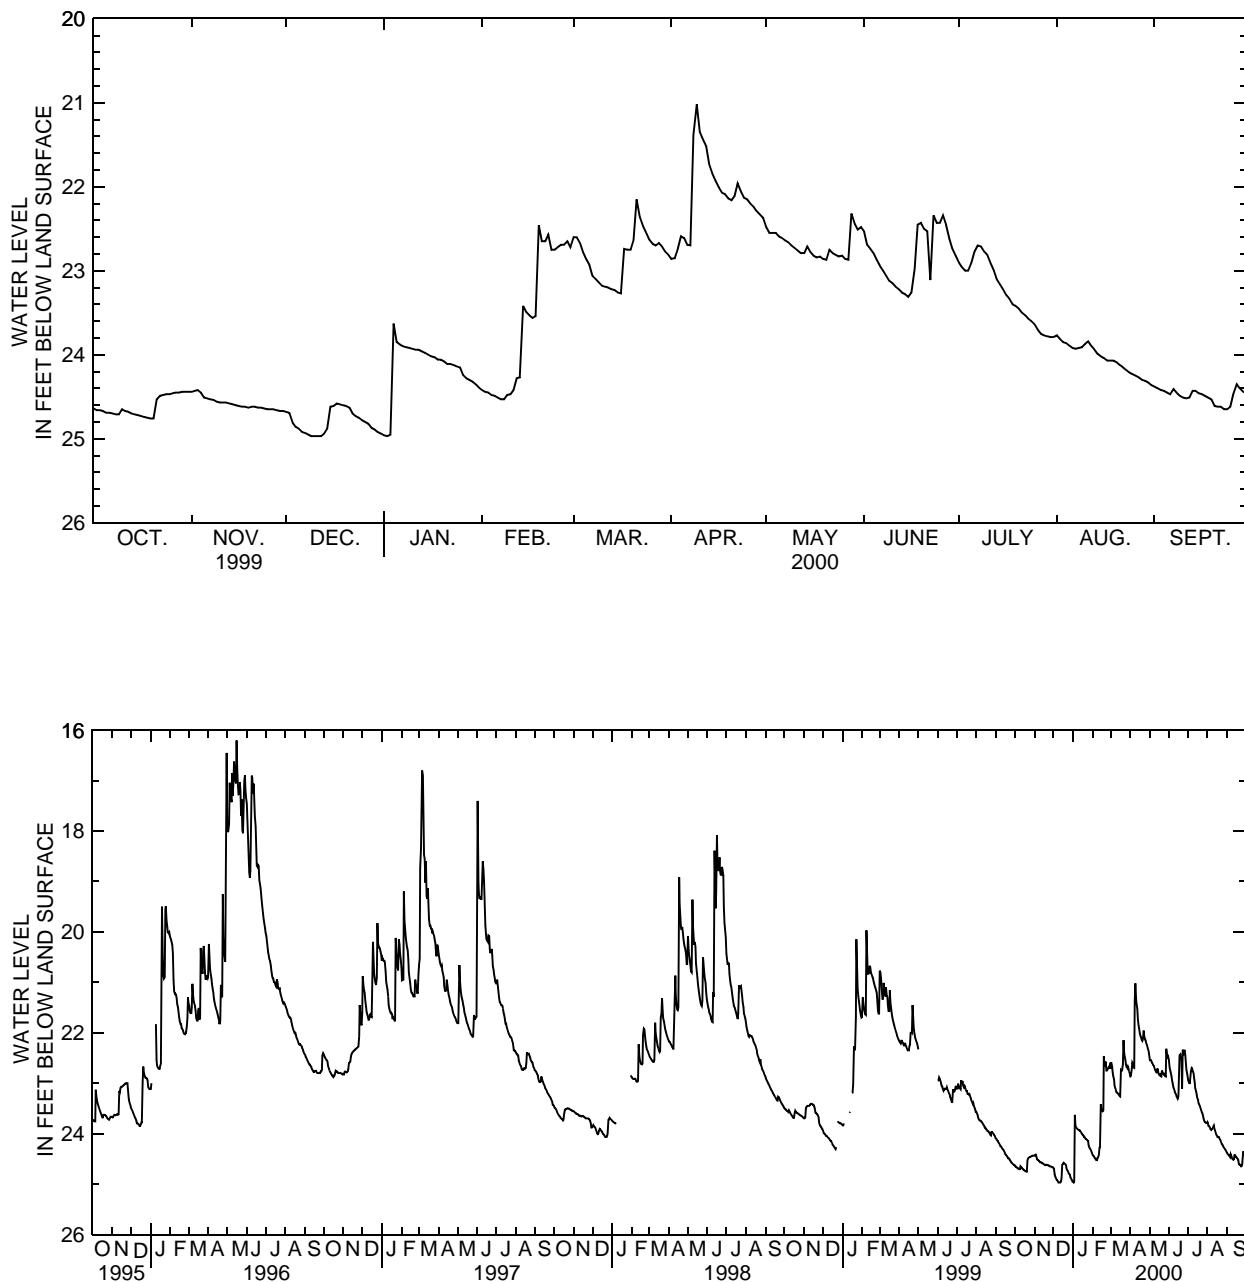

Figure 5. Sample of 1-year and 5-year hydrographs of well H-1 (391214084470100), completed in a unconfined unconsolidated aquifer.

WATER RESOURCES DATA—OHIO, 2000
Volume 2: St. Lawrence River Basin and Statewide Project Data

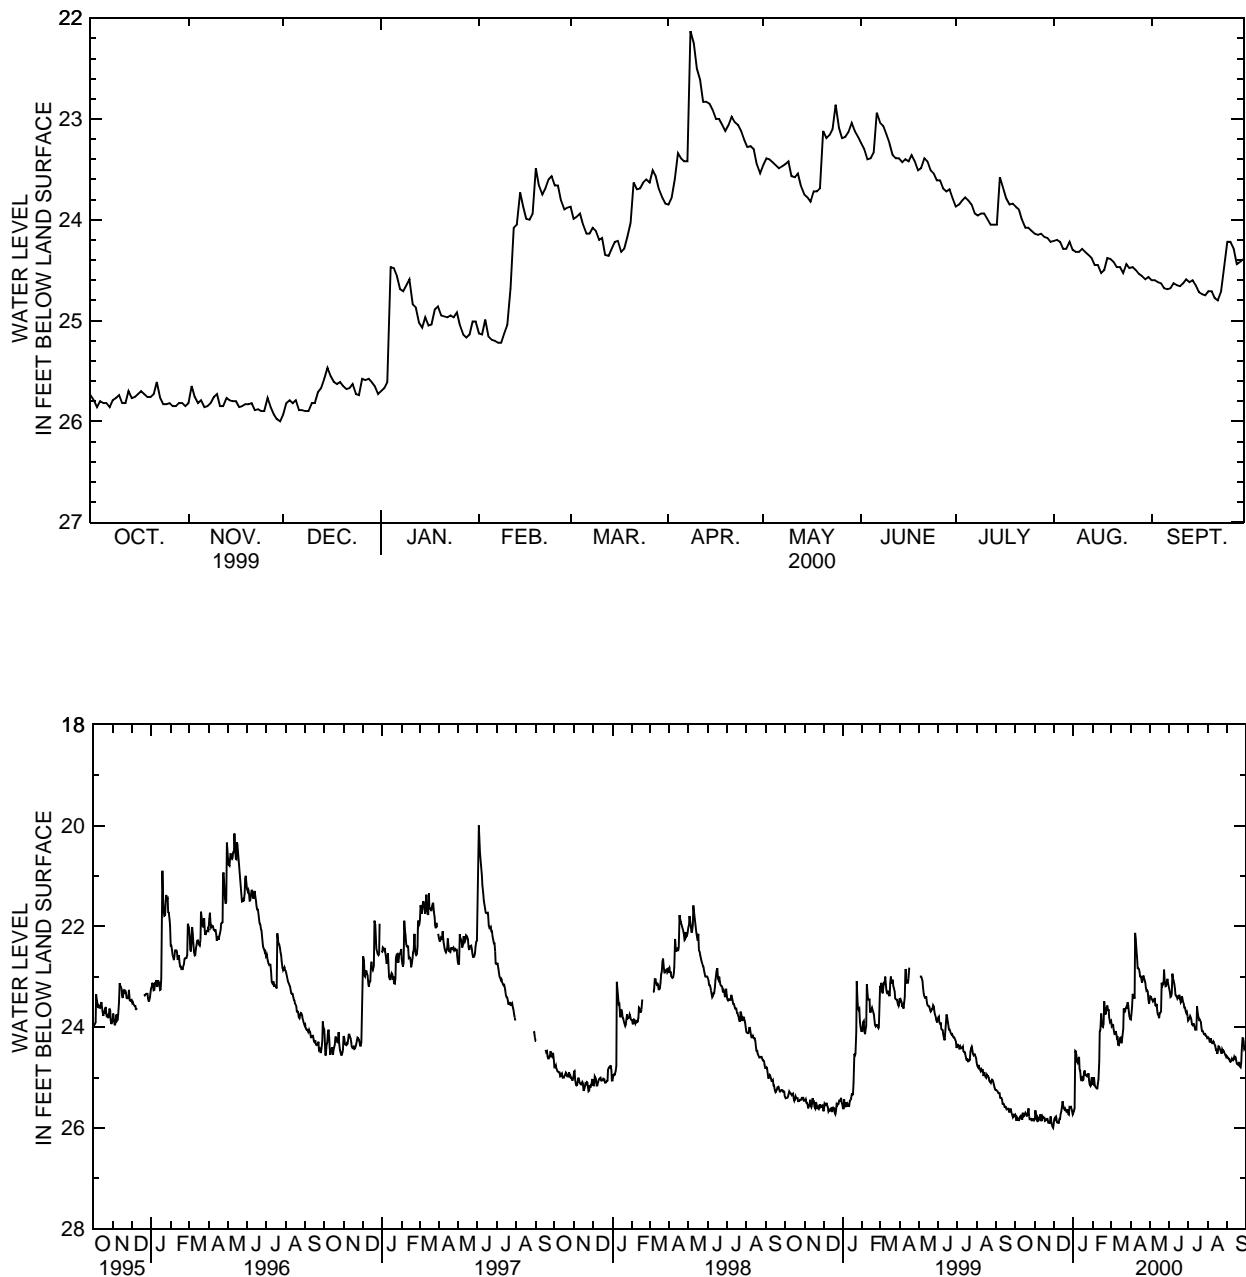

Figure 6. Sample of 1-year and 5-year hydrographs of well U-4 (401826083255200), completed in a confined carbonate-rock aquifer.

SPECIAL NETWORKS AND PROGRAM

Hydrologic Benchmark Network is a network of 50 sites in small drainage basins around the country whose purpose is to provide consistent data on the hydrology, including water quality, and related factors in representative undeveloped watersheds nationwide and to provide analyses on a continuing basis to compare and contrast conditions observed in basins more obviously affected by human activities.

National Stream-Quality Accounting Network (NASQAN) monitors the water quality of large rivers within four of the Nation's largest river basins—the Mississippi, Columbia, Colorado, and Rio Grande. Samples are collected with sufficient frequency that the flux of a wide range of constituents can be estimated. The objective of NASQAN is to characterize the water quality of these large rivers by measuring concentration and mass transport of a wide range of dissolved and suspended constituents, including nutrients, major ions, dissolved and sediment-bound heavy metals, common pesticides, and inorganic and organic forms of carbon. This information will be used (1) to describe the long-term trends and changes in concentration and transport of these constituents, (2) to test findings of the National Water-Quality Assessment Program (NAWQA), (3) to characterize processes unique to large-river systems, such as storage and remobilization of sediments and associated contaminants, and (4) to refine existing estimates of off-continent transport of water, sediment, and chemicals for assessing human effects on the world's oceans and for determining global cycles of carbon, nutrients, and other chemicals.

The National Atmospheric Deposition Program/National Trends Network (NADP/NTN) provides continuous measurement and assessment of the chemical climate of precipitation throughout the United States. As the lead Federal agency, the USGS works together with over 100 organizations to provide scientific investigators world-wide with a long-term, high-quality database of atmospheric deposition for research support in the areas of air quality, water quality, agricultural effects, forest productivity, materials effects, ecosystem studies, watershed studies and human health.

Data from the network, as well as information about individual sites, are available through the World Wide Web at <http://nadp.sws.uiuc.edu>.

The National Water-Quality Assessment (NAWQA) Program of the U.S. Geological Survey is a long-term program with goals to describe the status and trends of water-quality conditions for a large, representative part of the Nation's ground- and surface-water resources; provide an improved understanding of the primary natural and human factors affecting these observed conditions and trends; and provide information that supports development and evaluation of management, regulatory, and monitoring decisions by other agencies.

Assessment activities are being conducted in selected study units (major watersheds and aquifer systems) that represent a wide range of environmental settings nationwide and that account for a large percentage of the Nation's water use. A wide array of chemical constituents are being measured in ground water, surface water, streambed sediments, and fish tissues. The coordinated application of comparative hydrologic studies at a wide range of spatial and temporal scales will provide information for decision making by water-resources managers and a foundation for aggregation and comparison of findings to address water-quality issues of regional and national interest.

Communication and coordination between USGS personnel and other local, state, and Federal interests are critical components of the NAWQA Program. Each study unit has a local liaison committee consisting of representatives from key Federal, state, and local water-resources agencies, Indian nations, and universities in the study unit. Liaison committees typically meet semiannually to discuss their information needs, monitoring plans and progress, desired information products, and opportunities to collaborate efforts among the agencies.

Additional information about the NAWQA Program is available through the World Wide Web at http://water.usgs.gov/nawqa/nawqa_home.html.

EXPLANATION OF THE RECORDS

The records in this report are for the 2000 water year that began October 1, 1999, and ended September 30, 2000. A calendar of the water year is provided on the inside of the front cover. The records contain streamflow data, stage and content data for lakes and reservoirs, water-quality data for surface and ground water, and ground-water-level data. The following sections of the introductory text are presented to provide users with a more detailed explanation of how the hydrologic data published in this report were collected, analyzed, computed, and arranged for presentation.

Station Identification Numbers

Each data station, whether onstream or at a well, is assigned a unique identification number. The number is generally assigned when a station is first established and is retained for that station indefinitely. The systems used by the USGS to assign identification numbers for surface-water stations and for ground-water well sites differ, but both are based on geographic locations. The “downstream order” system is used for regular surface-water stations and the “latitude-longitude” system is used for wells and, in Ohio, for surface-water stations where only infrequent measurements are made.

Downstream Order System

Since October 1, 1950, the order of listing hydrologic-station records in USGS reports is in a downstream direction along the main stream. All stations on a tributary entering upstream from a main-stream station are listed before that station. A station on a tributary that enters between two main-stream stations is listed between them. A similar order is followed in listing stations on first rank, second rank, and other ranks of tributaries. The rank of any tributary with respect to the stream to which it is immediately tributary is indicated by an indentation in a “List of Stations” in the front of the report. Each indentation represents one rank. This downstream order and system of indentation show which stations are on tributaries between any two stations and the rank of the tributary on which each station is situated.

The station-identification number is assigned according to the above-mentioned downstream order. In assigning station numbers, no distinction is made between partial-record stations and other stations; therefore, the station number for a partial-record station indicates downstream-order position in a list made up of both types of stations. Gaps are left in the series of numbers to allow for new stations that may be established; hence, the numbers are not consecutive. The complete eight-digit number for each station such as 04041000, which appears just to the left of the station name, includes the two-digit part number “04” plus the six-digit downstream order number “041000.” The part number designates the major river basin; for example, part “03” is the Ohio River Basin, and part “04” is the St. Lawrence River Basin.

Latitude-Longitude System

The identification numbers for wells and miscellaneous surface-water sites are assigned according to the grid system of latitude and longitude. The number consists of 15 digits. The first six digits denote the degrees, minutes, and seconds of latitude, the next seven digits denote degrees, minutes, and seconds of longitude, and the last two digits (assigned sequentially) identify the wells or other sites within a 1-second grid. In the rare instance where the initial determination of latitude and longitude are found to be in error, the station will retain its initial identification number; however, its true latitude and longitude will be listed in the LOCATION paragraph of the station description. (See figure 7.)

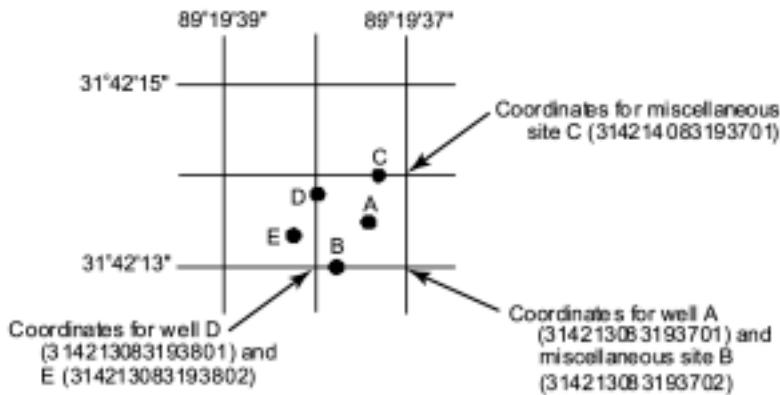

Figure 7. System for numbering wells and miscellaneous sites (latitude and longitude).

Records of Stage and Water Discharge

Records of stage and water discharge may be complete or partial. Complete records of discharge are those obtained using a continuous stage-recording device through which either instantaneous or mean discharge may be computed for any time, or any period of time, during the period of record. Complete records of lake or reservoir contents, similarly, are those for which stage or content may be computed or estimated with reasonable accuracy for any time or period of time. They may be obtained using a continuous stage-recording device but need not be. Because daily mean discharges and end-of-day contents commonly are published for such stations, they are referred to as “daily stations.”

By contrast, partial records are obtained through discrete measurements often without using a continuous stage-recording device and pertain only to a few flow characteristics, or perhaps only one. The nature of a partial record is indicated by table titles such as CREST-STAGE PARTIAL RECORDS or LOW-FLOW PARTIAL RECORDS. Records of miscellaneous discharge measurements or of measurements from special studies, such as low-flow seepage studies, may be considered as partial records, but they are presented separately in this report. Location of all complete-record and crest-stage stations for which data are given in this volume are shown in figures 1a through 1d.

Data Collection and Computation

The data obtained at a complete-record gaging station on a stream or canal consist of a continuous record of stage, individual measurements of discharge throughout a range of stages, and notations regarding factors that may affect the relations between stage and discharge. These data, together with supplemental information such as weather records, are used to compute daily discharges. The data obtained at a complete-record gaging station on a lake or reservoir consist of a record of stage and of notations regarding factors that may affect the relations between stage and lake content. These data are used with stage-area and stage-capacity curves or tables to compute water-surface areas and lake storage.

Continuous records of stage are obtained with digital recorders that store stage data on solid-state storage media at selected time intervals. Measurements of discharge are made with current meters using methods adapted by the USGS as a result of experience accumulated since 1880. These methods are described in standard textbooks, in Water-Supply Paper 2175, and in USGS Techniques of Water-Resources Investigations, Book 3, Chapter A6.

In computing discharge records, results of individual measurements are plotted against the corresponding

stages, and stage-discharge relation curves are then constructed. From these curves, rating tables indicating the approximate discharge for any stage within the range of the measurements are prepared. If it is necessary to define extremes of discharge outside the range of the current-meter measurements, the curves are extended using (1) logarithmic plotting, (2) velocity-area studies, (3) results of indirect measurements of peak discharge, such as slope-area or contracted-opening measurements, and computations of flow-over-dams or weirs, or (4) step-backwater techniques.

Daily mean discharges are computed by applying stages (gage heights) to the stage discharge curves or tables. If the stage-discharge relation is subject to change because of frequent or continual change in the physical features that form the control, the daily mean discharge is determined by the shifting-control method, in which correction factors based on the individual discharge measurements and notes of the personnel making the measurements are applied to the gage heights before the discharges are determined from the curve or tables. This shifting-control method also is used if the stage-discharge relation is changed temporarily because of aquatic growth or debris on the control. For some stations, formation of ice in the winter may so obscure the stage-discharge relation that daily mean discharges must be estimated from other information such as temperature and precipitation records, notes of observations, and records for other stations in the same or nearby basins for comparable periods.

At some stream-gaging stations the stage-discharge relation is affected by the backwater from reservoirs, tributary streams, or other sources. This necessitates the use of the slope method, in which the slope or fall in a reach of the stream is a factor in computing discharge. The slope or fall is obtained by means of an auxiliary gage set at some distance from the base gage. At some stations the stage-discharge relation is affected by changing stage; at these stations the rate of change in stage is used as a factor in computing discharge.

In computing records of lake or reservoir contents, it is necessary to have available from surveys or curves, tables defining the relation of stage and contents. The application of stage to the stage-contents curves or tables give the contents from which daily, monthly, or yearly changes are then determined. If the stage-contents relation changes because of deposition of sediment in a lake or reservoir, periodic resurveys may be necessary to redefine the relation. Even when this is done, the contents computed may become increasingly in error as time since the last survey increases. Discharges over lake or reservoir spillways are computed from stage-discharge relation much as other stream discharges are computed.

For some gaging stations there are periods when no gage-height record is obtained or the recorded gage height is so faulty that it cannot be used to compute daily discharge or contents. This happens when the recorder stops or otherwise fails to operate properly, intakes are plugged, the float is frozen in the well, or for various other reasons. For such periods, the daily discharges are estimated from the recorded range in stage, previous or following record, discharge measurements, weather records, and comparison with other station records from the same or nearby basins. Likewise, daily contents may be estimated from operator's logs, previous or following record, inflow-outflow studies, and other information.

At some gaging stations, acoustic velocity meter (AVM) systems are used to compute discharge. The AVM system measures the stream's velocity at one or more paths in the cross section. Coefficients are developed to relate this path velocity to the mean velocity in the cross section. Because the AVM sensors are fixed in position, the adjustment coefficients generally vary with stage. Cross-sectional area curves are developed to relate stage, recorded as noted above, to cross-section area. Discharge is computed by multiplying path velocity by the appropriate stage-related coefficient and area.

Data Presentation

The records published for each gaging station consist of two parts—the manuscript or station description and the data table for the current water year.

Station Manuscript. The manuscript provides, under various headings, descriptive information such as station location, period of record, historical extremes outside the period of record, record accuracy, and other remarks pertinent to station operation and regulation. The following information, as appropriate, is provided with each continuous record of discharge or lake content. Comments to follow clarify information presented under the various headings of the station description.

LOCATION.—Information on locations is obtained from the most accurate maps available. The location of the gage with respect to the cultural and physical features in the vicinity and with respect to the reference place mentioned in the station name is given. River mileage, given for only a few stations, was determined by methods given in “River Mileage Measurement,” Bulletin 14, Revision of October 1968, prepared by the Water Resources Council, or were provided by the U.S. Army Corps of Engineers.

DRAINAGE AREA.—Drainage areas are measured using the most accurate maps available. Because the types of maps available vary from one drainage basin to another, the accuracy of the drainage areas likewise varies. Drainage areas are updated as better maps become available.

PERIOD OF RECORD.—This indicates the period for which there are published records for the station or for an equivalent station. An equivalent station is one that was in operation at a time that the present station was not, and whose location was such that records from it can reasonably be considered equivalent with records from the present station.

REVISED RECORDS.—Published records, because of new information, occasionally are found to be incorrect, and revisions are printed in later reports. Listed under this heading are all the reports in which revisions have been published for the station and the water years to which the revisions apply. If a revision did not include daily, monthly, or annual figures of discharge, that fact is noted after the year dates as follows: (M) means that only the instantaneous maximum discharge was revised, (m) that only the instantaneous minimum was revised, and (P) that only the peak discharges were revised. If the drainage area has been revised, the report in which the most recently revised figure was first published is given.

GAGE.—The type of gage in current use, the datum of the current gage referred to sea level (National Geodetic Vertical Datum of 1929) unless otherwise noted, and a condensed history of the types, locations, and datums of previous gages are given under this heading.

REMARKS.—All periods of estimated daily discharge record will either be identified by date in this paragraph of the station description for water-discharge stations or be flagged in the daily discharge table. (See the section, “Identifying Estimated Daily Discharge.”) If a “remarks” statement is used to identify estimated record, the paragraph will begin with this information presented as the first entry. The paragraph is also used to present information relative to the accuracy of the records, to special methods of computation, and to conditions that affect natural flow at the station, in addition, possibly, to other pertinent items. For reservoir stations, information is given on the dam forming the reservoir, the capacity, outlet works and spillway, and purpose and use of the reservoir.

COOPERATION.—Records provided by a cooperating organization or obtained for the USGS by a cooperating organization are identified here.

EXTREMES FOR PERIOD OF RECORD.—In some headings “Extremes for Period of Record” is presented as a paragraph separate from summary statistics. Extremes may include maximum and minimum stages and maximum and minimum discharges or contents. Unless otherwise qualified, the maximum discharge or content is the instantaneous maximum corresponding to the highest stage that occurred. The highest stage may have been obtained from a graphic or digital recorder, from a crest-stage gage, or by direct observation of a nonrecording gage. If the maximum stage did not occur on the same day as the maximum discharge or content, it is given separately. Similarly, the minimum is the instantaneous minimum discharge, unless otherwise qualified, and was determined and is reported in the same manner as the maximum.

EXTREMES OUTSIDE PERIOD OF RECORD.—Included here is information concerning major floods or unusually low flows that occurred outside the stated period of record. The information may or may not have been obtained by USGS.

PEAK DISCHARGES ABOVE BASE FOR CURRENT YEAR—Presented as a separate table. For stations meeting certain criteria, all peak discharges and stages occurring during the water year and greater than a selected base discharge are presented under this heading. All peaks greater than the base discharge are listed with the maximum for the year footnoted by an asterisk (*). Peak discharges are not published for canals, ditches, drains, or streams for which the peaks are subject to substantial regulation or at locations where the instantaneous peak discharge does not exceed the mean daily discharge by 10 percent. The time of occurrence for peaks is expressed in 24-hour local standard time. For example, 12:30 a.m. is 0030, and 1:30 p.m. is 1330.

REVISIONS.—If a critical error in published records is discovered, a revision is included in the first report following discovery of the error.

Although rare, occasionally the records of a discontinued gaging station may need revision. Because, for these stations, there would be no current or, possibly, future station manuscript published to document the revision in a REVISED RECORDS entry, users of data for these stations who obtained the data from previously published data reports may wish to contact the District office to determine if the published records were ever revised after the station was discontinued. Of course, if the data were obtained by computer retrieval, the data would be current and there would be no need to check because any published retrieval of data is always accompanied by revisions of the corresponding data in computer storage.

Manuscript information for lakes or reservoir stations differs from that for stream stations in the nature of the REMARKS and in the inclusion of a skeleton stage-capacity table when daily contents are given.

Data Table of Daily Mean Values. The daily table for stream-gaging stations gives mean discharge for each day and is followed by monthly and yearly summaries. In the monthly summary below the daily table, the line headed TOTAL gives the sum of the daily figures. The line headed MEAN gives the average flow in cubic feet per second during the month. The lines headed MAX and MIN give the maximum and minimum daily discharges, respectively, for the month. Discharge for the month is often expressed in cubic feet per square mile (line headed CFSM), or in inches (line headed IN.), or in acre-feet (line headed AC-FT). Figures for cubic feet per second per square mile and runoff in inches are omitted if there is extensive regulation or diversion or if the drainage area includes large noncontributing areas. In the yearly summary below the monthly summary, the figures shown are the appropriate discharges for the calendar and water years. At some stations monthly and (or) yearly observed discharges are adjusted for reservoir storage or diversion, or diversions or reservoir contents are given. These figures are identified by symbol and corresponding footnote.

Statistics of Monthly Mean Data. A tabular summary of the mean (line headed MEAN), maximum (line headed MAX), and minimum (line headed MIN) of monthly mean flows for each month for a designated period is provided below the mean values table. The water years of the first occurrence of the maximum and minimum monthly flows are provided immediately below those figures. The designated period will be expressed as FOR WATER YEARS ____ - ____ BY WATER YEAR (WY), and will list the first and last water years of the range of years selected from the PERIOD OF RECORD paragraph in the station manuscript. It will consist of all of the station record within the specified water years, inclusive, including complete months of record for partial water years, if any, and may coincide with the period of record for the station. The water years for which the statistics are computed will be consecutive, unless a break in the station record is indicated in the manuscript.

Summary Statistics. A table titled SUMMARY STATISTICS follows the statistics of monthly mean data tabulation. This table consists of four columns, with the first column containing the line headings of the statistics being reported. The table provides a statistical summary of yearly, daily, and instantaneous flows, not only for the current water year but also for the previous calendar year and for a designated period, as appropriate. The designated period selected, WATER YEARS ____ - ____ , will consist of all of the station record within the specified water years, inclusive, including complete months of record for partial water years, if any, and may coincide with the period of record for the station. The water years for which the statistics are computed will be consecutive, unless a break in the station record is indicated in the manuscript. All of the calculations for the statistical characteristics designated ANNUAL (See line headings below), except for the ANNUAL SEVEN-DAY

MINIMUM statistic, are calculated for the designated period using complete water years. The other statistical characteristics may be calculated using partial water years.

The date or water year, as appropriate, of the first occurrence of each statistic reporting extreme values of discharge is provided adjacent to the statistic. Repeated occurrences may be noted in the REMARKS paragraph of the manuscript or in the footnotes. When the maximum or minimum statistic occurred outside the designated period, that statistic is listed in the EXTREMES FOR PERIOD OF RECORD paragraph in the manuscript. Selected streamflow-duration-curve statistics and runoff data are also given. Runoff data may be omitted if there is extensive regulation or diversion of flow in the drainage basin.

The following summary statistics data, as appropriate, are provided with each continuous record of discharge. Comments to follow clarify information presented under the various line headings of the summary statistics table.

ANNUAL TOTAL.—The sum of the daily mean values of discharge for the year. At some stations the annual total discharge is adjusted for reservoir storage or diversion. The adjusted figures are identified by a symbol and corresponding footnotes.

ANNUAL MEAN.—The arithmetic mean of the individual daily mean discharges for the year noted or for the designated period. At some stations the yearly mean discharge is adjusted for reservoir storage or diversion. The adjusted figures are identified by a symbol and corresponding footnotes.

HIGHEST ANNUAL MEAN.—The maximum annual mean discharge occurring for the designated period.

LOWEST ANNUAL MEAN.—The minimum annual mean discharge occurring for the designated period.

HIGHEST DAILY MEAN.—The maximum daily mean discharge for the year or for the designated period.

LOWEST DAILY MEAN.—The minimum daily mean discharge for the year or for the designated period.

ANNUAL SEVEN-DAY MINIMUM.—The lowest mean discharge for 7 consecutive days for a calendar year or a water year. Note that most low-flow frequency analyses of annual 7-day minimum flows use a climatic year (April 1–March 31). The date shown in the summary statistics table is the initial date of the 7-day period. (This value should not be confused with the 7-day 10-year low-flow statistic.)

INSTANTANEOUS PEAK FLOW.—The maximum instantaneous stage occurring for the water year or for the designated period. Note that secondary instantaneous peak discharges above a selected base discharge are given in the table “Peak Discharges and Stages at Continuous-Record Surface Discharge Stations.”

INSTANTANEOUS PEAK STAGE.—The maximum instantaneous stage occurring for the water year or for the designated period. If the dates of occurrence for the instantaneous peak flow and instantaneous peak stage differ, the “Remarks” paragraph in the manuscript or a footnote may be used to provide further information.

INSTANTANEOUS LOW FLOW.—The minimum instantaneous discharge occurring for the water year or for the designated period.

ANNUAL RUNOFF.—Indicates the total quantity of water in runoff for a drainage area for the year. Data reports may use any of the following units of measurement in presenting annual runoff data:

Acre-foot (AC-FT) is the quantity of water required to cover 1 acre to a depth of 1 foot and is equivalent to 43,560 cubic feet or about 326,000 gallons or 1,233 cubic meters.

Cubic feet per second per square mile (CFSM) is the average number of cubic feet of water flowing per second from each square mile of area drained, assuming that the runoff is distributed uniformly in time and area for the area. Inches (INCHES) indicates the depth to which the drainage area would be covered if all the runoff for a given time period were uniformly distributed on it.

10 PERCENT EXCEEDS.—The discharge that has been exceeded 10 percent of the time for the designated period.

50 PERCENT EXCEEDS.—The discharge that has been exceeded 50 percent of the time for the designated period.

90 PERCENT EXCEEDS.—The discharge that has been exceeded 90 percent of the time for the designated period.

Data collected at partial-record stations follow the information for continuous-record sites. Data for partial-record discharge stations are usually presented in two tables. The first is a table of annual maximum stage and discharge at crest-stage stations, and the second, when collected, is a table of discharge measurements at low-flow partial-record stations. The tables of partial-record stations are followed by a listing of discharge measurements made at sites other than continuous-record or partial-record stations. These measurements are generally made in time of drought or flood to give better areal coverage to those events. Those measurements and others collected for some special reason are called measurements at miscellaneous sites.

Identifying Estimated Daily Discharge

Estimated daily discharge values published in the water-discharge tables of annual state data reports are identified either by flagging individual daily values with the letter "e" and printing a table footnote, "e Estimated," or by listing the dates of the estimated record in the REMARKS paragraph of the station description.

Accuracy of the Records

The accuracy of streamflow records depends primarily on (1) the stability of the stage-discharge relation or, if the control is unstable, the frequency of discharge measurements, and (2) the accuracy of measurements of stage, measurements of discharge, and interpretation of records.

The accuracy attributed to the records is indicated under REMARKS. "Excellent" means that about 95 percent of the daily discharges are within 5 percent of the true; "good," within 10 percent; and "fair," within 15 percent. Records that do not meet the criteria mentioned are rated "poor." Different accuracies may be attributed to different parts of a given record.

Daily mean discharges in this report are given to the nearest hundredths of a cubic foot per second for values less than 1 ft³/s; to the nearest tenth between 1.0 and 10 ft³/s; to whole numbers between 10 and 1,000 ft³/s; and to three significant figures for more than 1,000 ft³/s. The number of significant figures used is based solely on the magnitude of the discharge value. The same rounding rules apply to discharges listed for partial-record stations and miscellaneous sites.

Discharge at many stations, as indicated by the monthly mean, may not reflect natural runoff due to the effects of diversion, consumption, regulation by storage, increase or decrease in evaporation due to artificial causes, or other factors. For such stations, figures of cubic feet per second per square mile and of runoff, in inches, are not published unless satisfactory adjustments can be made for diversions, for changes in contents of reservoirs, or for other changes incident to use and control. Evaporation from a reservoir is not included in the adjustments for changes in reservoir contents, unless it is so stated. Even at those stations where adjustments are made, large errors in computed runoff may occur if adjustments or losses are large in comparison with the observed discharge.

Other Records Available

Information used in preparing the records in this publication, such as discharge-measurement notes, gage-height records, temperature measurements, and rating tables are on file in the Ohio District office. Also, most of the daily mean discharges are in computer-readable form and have been analyzed statistically. Information on availability of the unpublished information or on results of statistical analyses of the published records may be obtained from the District office.

Records of Surface-Water Quality

Records of surface-water quality ordinarily are obtained at or near stream-gaging stations because interpretation of records of surface-water quality nearly always requires corresponding discharge data. Records of surface-water quality in this report may involve a variety of types of data and measurement frequency.

Classification of Records

Water-quality data for surface-water sites are grouped into one of three classifications. A continuing-record station is a site where data are collected on a regularly scheduled basis. Frequency may be once or more times daily, weekly, monthly, or quarterly. A partial-record station is a site where limited water-quality data are collected systematically over a period of years. Frequency of sampling is usually less than quarterly. A miscellaneous sampling site is a location other than a continuing or partial-record station, where random samples are collected to give better areal coverage to define water-quality conditions in the river basin.

A careful distinction needs to be made between “continuing records” as used in this report and “continuous recordings,” which refers to a continuous series of discrete values collected at short intervals and recorded electronically. Some records of water quality, such as temperature and specific conductance, may be obtained through continuous recording; however, because of cost, most data are obtained only monthly or less frequently. Locations of stations for which records on the quality of surface water appear in this volume are shown in figures 1a and 1b.

Arrangement of Records

Water-quality records collected at a surface-water daily record station are published immediately following that record, regardless of the frequency of sample collection. Station number and name are the same for both records. Where a surface-water daily record station is not available or where the water quality differs significantly from that at a nearby surface-water station, the continuing water-quality record is published with its own station number and name in the regular downstream-order sequence. Water-quality data for partial-record stations and for miscellaneous sampling sites appear in separate tables following the table of “DISCHARGE MEASUREMENTS.”

Onsite Measurement and Sample Collection

In obtaining water-quality data, a major concern is that the data obtained represent the in situ quality of the water. To ensure this, certain measurements, such as water temperature, pH, and dissolved oxygen, need to be made on site when the samples are taken. To ensure that measurements made in the laboratory also represent the in situ water, carefully prescribed procedures need to be followed in collecting the samples, in treating the sample to prevent changes in quality pending analysis, and in shipping the samples to the laboratory. Procedures for onsite measurements and for collecting, treating, and shipping samples are given in water-quality-related chapters in the series “Techniques of Water-Resources Investigations” (TWRI), which are listed in this report, and in other documents listed on the World Wide Web page for the USGS, Water Resources Division, Office of Water Quality (<http://water.usgs.gov/owq>). Additional information on collecting, treating, and shipping samples can be found in USGS Water-Resources Investigations Report 98-4057 “Quality-Assurance/Quality-Control Manual for Collection and Analysis of Water-Quality Data in the Ohio District, U.S. Geological Survey.”

One sample can define adequately the water quality at a given time if the mixture of solutes throughout the stream cross section is homogeneous. However, the concentration of solutes at different locations in the cross section may vary widely with different rates of water discharge, depending on the source of material and the turbulence and mixing of the stream. Some streams must be sampled through several vertical sections to obtain a representative sample needed for an accurate mean concentration and for use in calculating load. All samples

obtained for the National Stream-Quality Accounting Network (see definitions) are obtained from at least several verticals. Whether samples are obtained from the centroid of flow or from several verticals depends on flow conditions and other factors that must be evaluated by the collector.

Chemical-quality data published in this report are considered to be the most representative values available for the stations listed. The values reported represent water-quality conditions at the time of sampling as much as possible, consistent with available sampling techniques and methods of analysis. In the rare case where an apparent inconsistency exists between a reported pH value and the relative abundance of carbon dioxide species (carbonate and bicarbonate), the inconsistency is the result of a slight uptake of carbon dioxide from the air by the sample between measurement of pH in the field and determination of carbonate and bicarbonate in the laboratory.

For chemical-quality stations equipped with digital monitors, the records consist of daily maximum, minimum, and mean values for each constituent measured and are based upon hourly readings beginning at 0100 hours and ending at 2400 hours for each day of record. More detailed records (hourly values) may be obtained from the USGS District Office, whose address is given on the back of the title page of this report.

Water Temperatures

Water temperatures are measured at most of the water-quality stations. In addition, water temperatures are frequently taken at the time of discharge measurements for water-discharge stations. For stations where water temperatures are taken manually once or twice daily, the water temperatures are taken at about the same time each day. Large streams have a small daily temperature change; shallow streams may have a daily range of several degrees and may follow closely the changes in air temperature. Some streams may be affected by waste-heat discharges.

At stations where recording instruments are used, either mean temperatures or maximum and minimum temperatures for each day are published.

Sediment

Suspended-sediment concentrations are determined from samples collected by using depth-integrating samplers. Samples usually are obtained at several verticals in the cross section, or a single sample may be obtained at a fixed point and a coefficient applied to determine the mean concentration in the cross section.

During periods of rapidly changing flow or rapidly changing concentration, samples may have been collected more frequently (twice daily or, in some instances, hourly). The published sediment discharge for days of rapidly changing flow or concentration was computed by the subdivided-day method (time-discharge weighted average). Therefore, for those days when the published sediment discharge values differ from the value computed as the product of discharge times mean concentration times 0.0027, the reader can assume that the sediment discharge for that day was computed by the subdivided-day method. For periods when no samples were collected, daily loads of suspended sediment were estimated on the basis of water discharge, sediment concentrations observed immediately before and after the periods, and suspended-sediment loads for other periods of similar discharge.

At other stations, suspended-sediment samples were collected periodically at many verticals in the stream cross section. Although data collected periodically may represent conditions only at the time of observation, such data are useful in establishing seasonal relations between quality and streamflow and in predicting long term sediment-discharge characteristics of the stream.

In addition to the records of the quantities of suspended sediment, records of periodic measurements of the particle-size distribution of the suspended sediment and bed material are included for some stations.

Laboratory Measurements

Sediment samples, samples for microbiological analyses, and samples for specific conductance, pH, and dissolved oxygen are analyzed locally. All other samples are analyzed in the USGS laboratories in Arvada, Colo., or by a USGS-approved outside laboratory. Methods used in analyzing sediment samples and computing sediment records are given in the series “Techniques of Water-Resources Investigations” (TWRI), which are listed in this report, and in other documents listed on the World Wide Web page for USGS, Water Resources Division, Office of Water Quality (<http://water.usgs.gov/owq>).

Data Presentation

For continuing-record stations, information pertinent to the history of station operation is provided in descriptive headings preceding the tabular data. These descriptive headings give details regarding location, drainage area, period of record, type of data available, instrumentation, general remarks, cooperation, and extremes for parameters currently measured daily. Tables of chemical, physical, biological, radiochemical data, and so forth, obtained at a frequency less than daily, are presented first. Tables of “daily values” of specific conductance, pH, water temperature, dissolved oxygen, and suspended sediment then follow in sequence.

In the descriptive headings, if the location is identical to that of the discharge-gaging station, neither the LOCATION nor the DRAINAGE AREA statements are repeated. The following information, as appropriate, is provided with each continuous-record station. Comments that follow clarify information presented under the various headings of the station description.

LOCATION.—See Data Presentation under “Records of Stage and Water Discharge”; same comments apply.

DRAINAGE AREA.—See Data Presentation under “Records of Stage and Water Discharge”; same comments apply.

PERIOD OF RECORD.—This indicates the periods for which there are published water-quality records for the station. The periods are shown separately for records of parameters measured daily or continuously and those measured less than daily. For those measured daily or continuously, periods of record are given for the parameters individually.

INSTRUMENTATION.—Information on instrumentation is given only if a water-quality monitor, temperature record, sediment pumping sampler, or other sampling device is in operation at a station.

REMARKS.—Remarks provide added information pertinent to the collection, analysis, or computation of the record.

COOPERATION.—Records provided by a cooperating organization or obtained for the USGS by a cooperating organization are identified here.

EXTREMES.—Maximums and minimums are given only for parameters measured daily or more frequently. None are given for parameters measured weekly or less frequently because the true maximums and minimums may not have been sampled. Extremes, when given, are for both the period of record and for the current water year.

REVISIONS.—If errors in published water-quality records are discovered after publication, appropriate updates are made in the USGS computerized data system, the National Water Information System (NWIS). Because the usual volume of updates makes it impractical to document individual changes in the State data-report series or elsewhere, potential users of USGS water-quality data are encouraged to obtain all required data from the appropriate computer file to ensure the most recent updates.

Remark Codes

The following remarks codes may appear with the water-quality data in this report.

| | |
|------|--|
| E, e | Estimated value |
| > | Actual value is known to be greater than the value shown |
| < | Actual value is known to be less than the value shown |
| K, k | Results based on colony count outside the acceptable range (non-ideal colony count) |
| L | Biological organism count less than 0.5 percent (organism may be observed rather than counted) |
| D | Biological organism count equal to or greater than 15 percent (dominant) |
| & | Biological organism estimated as dominant |
| V | Analyte was detected in both the environmental sample and the associated blanks |

The USGS National Water Quality Laboratory collects quality-control data on a continuing basis to evaluate selected analytical methods to determine long-term method detection levels (LT-MDLs) and laboratory reporting levels (LRLs). These values are re-evaluated each year on the basis of the most recent quality-control data and, consequently, may change from year to year.

This reporting procedure limits the occurrence of false positive error. The chance of falsely reporting a concentration greater than the LT-MDL for a sample in which the analyte is not present is 1 percent or less. Application of the LRL limits the occurrence of false negative error. The chance of falsely reporting a non-detection for a sample in which the analyte is present at a concentration equal to or greater than the LRL is 1 percent or less.

Accordingly, concentrations are reported as <LRL for samples in which the analyte was either not detected or did not pass identification. Analytes that are detected at concentrations between the LT-MDL and LRL and that pass identification criteria are estimated. Estimated concentrations will be noted with a remark code of "E". These data should be used with the understanding that their uncertainty is greater than that of data reported without the "E" remark code.

Dissolved Trace-Element Concentrations

NOTE.—To confidently produce dissolved trace-element data with insignificant contamination, the USGS began using a new trace-element protocol at some stations in water year 1994 to collect trace-element data at the microgram per liter ($\mu\text{g/L}$) level (refer to USGS Open-File Report 94-539 "U.S. Geological Survey Protocol for the Collection and Processing of Surface-Water Samples for the Subsequent Determination of Inorganic Constituents in Filtered Water"). This protocol was used in the current water year at all stations. Therefore, the trace-element data for samples collected before and after implementation of new protocols are not directly comparable.

Change in National Trends Network Procedures

NOTE.—Sample handling procedures at all National Trends Network stations were changed substantially on January 11, 1994, in order to reduce contamination from the sample shipping container. The data for samples before and after that date are different and not directly comparable. A tabular summary of the differences based on a special intercomparison study, is available from the NADP/NTN Program Office (Telephone: 217-333-7873).

Records of Ground-Water Levels

Water-level data from a network of observation wells (in addition to project wells) are given in this report. The network well data are intended to provide a sampling and historical record of water-level changes in the Nation's most important aquifers. Locations of the observation wells in this network in Ohio are shown in figures 1a and 1b. Water-level data for specific projects are reported under those projects.

Data Collection and Computation

Measurements of water levels are made in many types of wells under varying conditions, but the methods of measurement are standardized to the extent possible. The equipment and measuring techniques used at each observation well ensure that measurements at each well are of consistent accuracy and reliability.

Tables of water-level data are presented by counties arranged in alphabetical order. The prime identification number for a given well is a 15-digit number that is based on latitude and longitude. The secondary identification number is the local well number, which is provided for local needs. Water-level measurements in this report are given in feet with reference to land-surface datum. Land-surface datum is a datum plane that is approximately at land surface at each well. If known, the altitude of the land-surface datum above sea level is given in each well description. The height of the measuring point (MP) above or below land-surface datum is given in each well description.

Water levels are reported to as many significant figures as can be justified by the local conditions. For example, in a measurement of a depth to water of several hundred feet, the error of determining the absolute value of the total depth to water may be a few tenths of a foot, whereas the error in determining the net change of water level between successive measurements may be only a hundredth or a few hundredths of a foot. For lesser depths to water, the accuracy is greater. Accordingly, most measurements are reported to a hundredth of a foot, but some are given to a tenth of a foot or larger units.

Data Presentation

Each well record consists of two parts, the station description and the data table of water levels observed during the water year. The description of the well is presented first through use of descriptive headings preceding the tabular data. The comments to follow clarify information presented under the various headings.

LOCATION.—This paragraph follows the well-identification number and reports the latitude and longitude (given in degrees, minutes, and seconds), a landline location designation, the hydrologic-unit number, the distance and direction from a geographic point of reference, and the owner's name.

AQUIFER.—This entry describes the aquifer by age and composition.

WELL CHARACTERISTICS.—This entry describes the well in terms of depth, diameter, casing depth and (or) screened interval, method of construction, use, and additional information such as casing breaks, collapsed screen, and other changes since construction.

DATUM.—This entry describes both the measuring point and the land-surface altitude at the well. The measuring point is described physically (such as top of collar, notch in top of casing, plug in pump base, and so on) and in relation to land surface (such as 1.3 ft above land-surface datum). The altitude of the land-surface datum is described in feet above (or below) sea level; it is reported with a precision depending on the method of determination.

REMARKS.—This entry describes factors that may influence the water level in a well or the measurement of the water level. It should identify wells that are also water-quality observation wells, and may be used to acknowledge the assistance of local (non-USGS) observers.

PERIOD OF PUBLISHED RECORD.—This entry indicates the period for which there are published records for the well. It reports the month and year of the start of publication of water level records by the USGS or cooperating agency, and the words "to current year" if the records are to be continued

to the following year. Periods for which water-level records are available, but not published by the USGS, may be noted.

EXTREMES FOR PERIOD OF PUBLISHED RECORD.—This entry contains the highest and lowest water levels of the period of published record, with respect to land-surface datum, and the dates of their occurrence.

A table of water levels follows the station description for each well. Water levels are reported in feet below (or above) land-surface datum. All periodic measurements of water levels for wells are listed. For wells equipped with recorders, daily water-level lows are published. The highest and lowest daily lows of the water year are shown on a line below the table. Because only daily lows are published for wells with recorders, the extreme instantaneous high may be a value that is not listed in the table. Missing records are indicated by dashes in place of the water level.

Records of Ground-Water Quality

Records of ground-water quality in this report differ from other types of records in that, for most sampling sites, they consist of only one set of measurements. The quality of ground water ordinarily changes slowly, so that frequent measuring of the same parameter is not necessary unless one is concerned with a particular problem such as monitoring for trends of a particular constituent.

Data Collection and Computation

The records of ground-water quality in this report were obtained mostly as part of special studies in specific areas. Consequently, a number of chemical analyses are presented for some counties, but none are presented for others. As a result, the records for this year, by themselves, do not provide a balanced view of ground-water quality statewide. Such a view can be attained only by considering records for this year in context with similar records obtained for these and other counties in earlier years.

Most methods for collecting and analyzing water samples are described in the TWRI manuals listed in this report and on the World Wide Web page for the Office of Water Quality (<http://water.usgs.gov/owq>). The data presented in this report represent water-quality conditions at the time of sampling as much as possible, consistent with available sampling techniques and methods of analysis. All samples were obtained by trained personnel. The wells sampled were pumped long enough to ensure that the water collected came directly from the aquifer and had not stood for a long time in the well casing, where it would have been exposed to the atmosphere and the material comprising the casings.

Data Presentation

The records of ground-water quality are published intermixed with the ground-water-level data for network wells and with the specific project for project wells.

ACCESS TO USGS WATER DATA

The USGS provides near real-time stage and discharge data for many of the gaging stations equipped with the necessary telemetry and historic daily-mean and peak-flow discharge data for most current or discontinued gaging stations through the World Wide Web. These data may be accessed at <http://water.usgs.gov>

Some water-quality and ground-water data also are available through the web. In addition, data can be provided in various machine-readable formats. Information about the availability of specific types of data or products, and user charges, can be obtained locally from each of the Water Resources Division District Offices.

DEFINITION OF TERMS

Terms related to streamflow, water quality, and other hydrologic data, as used in this report, are defined below. See also the table for converting inch-pound units to International System of units (SI) on the inside of the back cover.

Acid neutralizing capacity (ANC) is the equivalent sum of all bases or base-producing materials, solutes plus particulates, in an aqueous system that can be titrated with acid to an equivalence point. This term designates titration of an “unfiltered” sample (formerly reported as alkalinity).

Acre-foot (AC-FT, acre-ft) is the quantity of water required to cover 1 acre to a depth of 1 foot, and is equivalent to 43,560 cubic feet or about 326,000 gallons or 1,233 cubic meters.

Adenosine triphosphate (ATP) is an organic, phosphate-rich compound important in the transfer of energy in organisms. Its central role in living cells makes it an excellent indicator of the presence of living material in water. A measure of ATP therefore provides a sensitive and rapid estimate of biomass. ATP is reported in micrograms per liter of the original water sample.

Algae are mostly aquatic single-celled, colonial, or multicelled plants, containing chlorophyll and lacking roots, stems, and leaves.

Algal growth potential (AGP) is the maximum dry weight biomass that can be produced in a natural water sample under standardized laboratory conditions. The growth potential is the algal biomass present at stationary phase and is expressed as milligrams dry weight of algae produced per liter of sample.

Alkalinity is the capacity of solutes in an aqueous system to neutralize acid. This term designates titration of a “filtered” sample.

Annual runoff is the total quantity of water in runoff for a drainage area. Runoff data may be reported as inches (depth to which the drainage area would be covered with water if all the runoff were distributed uniformly in time and area) or as acre-feet or cubic feet per second per square mile (both units defined elsewhere in this list).

Aquifer is a geologic formation, group of formations, or part of a formation that contains sufficient saturated permeable material to yield reasonable quantities of water to wells and springs.

Artesian means confined, and is used to describe a well in which the water level stands above the top of the aquifer tapped by the well. A flowing artesian well is one in which the water level is above the land surface.

Bacteria are microscopic unicellular organisms, typically spherical, rodlike, or spiral and threadlike in shape, often clumped into colonies. Some bacteria cause disease, but others perform an essential role in nature in the recycling of materials; for example, by decomposing organic matter into a form available for reuse by plants.

Clostridium perfringens (*C. perfringens*) is a spore-forming bacterium that is common in the feces of humans and other warm-blooded animals. Clostridial spores are being used experimentally as an indicator of past fecal contamination and presence of microorganisms that are resistant to disinfection and environmental stresses. *C. perfringens* is a rod-shaped, anaerobic, gram-positive bacterium that produces acid phosphatase and also toxins that cause gas gangrene and gastroenteritis. After inoculation on mCP agar and anaerobic incubation at 42°C for 24 hours, *C. perfringens* forms colonies that turn pink to magenta upon exposure to ammonium hydroxide fumes.

Enterococcus bacteria are commonly found in the feces of humans and other warm-blooded animals. Although some strains are ubiquitous and not related to fecal pollution, the presence of enterococci in water is an indication of fecal pollution and the possible presence of enteric pathogens. Enterococcus bacteria are those bacteria that produce pink to red colonies with black or reddish-brown precipitate after incubation at 41°C on mE agar and subsequent transfer to EIA medium. Enterococci include *Streptococcus faecalis*, *Streptococcus faecium*, *Streptococcus avium*, and their variants.

Escherichia coli (*E. coli*) are bacteria present in the intestine and feces of warm-blooded animals.

E. coli are a member species of the fecal coliform group of indicator bacteria. In the laboratory they are defined as those bacteria that produce yellow or yellow-brown colonies on a filter pad saturated with urea substrate broth after primary culturing for 22 to 24 hours at 44.5°C on mTEC medium.

Fecal coliform bacteria are bacteria that are present in the intestine or feces of warm-blooded animals. They are often used as indicators of the sanitary quality of the water. In the laboratory, they are defined as all organisms that produce blue colonies within 24 hours when incubated at $44^{\circ}\text{C} \pm 0.2^{\circ}\text{C}$ on M-FC medium (nutrient medium for bacterial growth). Their concentrations are expressed as number of colonies per 100 mL of sample.

Fecal streptococcal bacteria are bacteria found also in intestine of warm-blooded animals. Their presence in water is considered to verify fecal pollution. They are characterized as gram-positive, coccis bacteria that are capable of growth in brain-heart infusion broth. In the laboratory, they are defined as all the organisms that produce red or pink colonies within 48 hours at $35^{\circ}\text{C} \pm 1.0^{\circ}\text{C}$ on KF-streptococcus medium (nutrient medium for bacterial growth). Their concentrations are expressed as number of colonies per 100 mL of sample.

Total coliform bacteria are a particular group of bacteria that are used as indicators of possible sewage pollution. They are characterized as aerobic or facultative anaerobic, gram-negative, nonspore-forming, rod-shaped bacteria that ferment lactose with gas formation within 48 hours at 35°C . In the laboratory, these bacteria are defined as the organisms that produce colonies with a golden-green metallic sheen within 24 hours when incubated at $35^{\circ}\text{C} \pm 1.0^{\circ}\text{C}$ on M-Endo medium (nutrient medium for bacterial growth). Their concentrations are expressed as number of colonies per 100 mL of sample.

Bed material is the unconsolidated material of which a streambed, lake, pond, reservoir, or estuary bottom is composed.

Benthic organisms (invertebrates) are the group of animals inhabiting the bottom of an aquatic environment. They include microinvertebrates (such as bacteria and fungi) and macroinvertebrates (such as insect larvae and nymphs, snails, clams, and crayfish). They are useful as indicators of water quality.

Biochemical oxygen demand (BOD) is a measure of the quantity of dissolved oxygen, in milligrams per liter, necessary for the decomposition of organic matter by microorganisms, such as bacteria.

Biomass is the amount of living matter present at any given time, expressed as the mass per unit area or volume of habitat.

Ash mass is the mass or amount of residue present after the residue from the dry mass determination has been in a muffle furnace at a temperature of 500°C for 1 hour. The ash mass values of zooplankton and phytoplankton are expressed in grams per cubic meter (g/m^3) and periphyton and benthic organisms in grams per square meter (g/m^2).

Dry mass refers to the mass of residue present after drying in an oven at 105°C for zooplankton and periphyton, until the mass remains unchanged. This mass represents the total organic matter, ash, and sediment, in the sample. Dry-mass values are expressed in the same units as ash mass.

Organic mass or volatile mass of the living substance is the difference between the dry mass and the ash mass and represents the actual mass of the living matter. The organic mass is expressed in the same units as for ash and dry mass.

Wet mass is the mass of living matter plus contained water.

Bottom material: See Bed material.

Cells/volume refers to the number of cells of any organism, which are counted by using a microscope and grid or counting cell. Many planktonic organisms are multicelled and are counted according to the number of contained cells per sample, usually milliliters (mL) or liters (L).

Cfs-day is the volume of water represented by a flow of 1 cubic foot per second for 24 hours. It is equivalent to 86,400 cubic feet, approximately 1.9835 acre-feet, about 646,000 gallons, or 2,447 cubic meters.

Chemical oxygen demand (COD) is a measure of the chemically oxidizable material in the water and furnishes an approximation of the amount of organic and reducing material present. The determined value may correlate with carbonaceous organic pollution from sewage or industrial wastes.

Chlorophyll refers to the green pigments of plants. Chlorophyll *a* and *b* are the two most common pigments in plants.

Coliphages are viruses that infect and replicate in *Escherichia coli* bacteria. They are indicative of sewage contamination of waters and of the survival and transport of viruses in the environment.

Color unit is produced by one milligram per liter of platinum in the form of the chloroplatinate ion. Color is expressed in units of the platinum-cobalt scale.

Contents is the volume of water in a reservoir or lake. Unless otherwise indicated, volume is computed on the basis of a level pool and does not include bank storage.

Control designates a feature downstream from the gage that determines the stage-discharge relation at the gage. This feature may be a natural constriction of the channel, an artificial structure, or a uniform cross section over a long reach of the channel.

Control structure, as used in this report, is a structure on a stream or canal that is used to regulate the flow or stage of the stream.

Cubic foot per second (cfs, ft³/s) is the rate of discharge representing a volume of 1 cubic foot passing a given point during 1 second and is equivalent to approximately 7.48 gallons per second or 448.8 gallons per minute or 0.02832 cubic meters per second.

Cubic feet per second per square mile (CFSM) is the average number of cubic feet of water flowing per second from each square mile of area drained, assuming that the runoff is distributed uniformly in time and area.

Datum, as used in this report, is an elevation above sea level to which gage-height readings are referenced.

Discharge is the volume of water (or more broadly, volume of fluid plus suspended sediment) that passes a given point within a given period of time.

Annual 7-day minimum is the lowest mean discharge for 7 consecutive days in a year. Note that most low-flow frequency analyses of annual 7-day minimum flows use a climatic year (April 1–March 31). The date shown in the summary statistics table is the initial date of the 7-day period. (This value should not be confused with the 7-day 10-year low-flow statistic.)

Mean discharge (MEAN) is the arithmetic mean of individual daily mean discharges during a specific period.

Instantaneous discharge is the discharge at a particular instant of time.

Dissolved: That material in a representative water sample that passes through a 0.45-micrometer membrane filter. This is a convenient operational definition used by Federal agencies that collect water data. Determinations of “dissolved” constituents are made on subsamples of the filtrate.

Dissolved oxygen (DO) content of water in equilibrium with air is a function of atmospheric pressure, temperature, and dissolved-solids concentration of the water. The ability of water to retain oxygen decreases with increasing temperature or dissolved solids, with small temperature changes having the more significant offset. Photosynthesis and respiration may cause diurnal variations in dissolved-oxygen concentration in water from some streams.

Dissolved solids concentration of water is determined either analytically by the “residue-on-evaporation” method, or mathematically by totalling the concentrations of individual constituents reported in a comprehensive chemical analysis. During the analytical determination of dissolved solids, the bicarbonate (generally a major dissolved component of water) is converted to carbonate. Therefore, in the mathematical calculation of dissolved-solids concentration, the bicarbonate value, in milligrams per liter, is multiplied by 0.492 to reflect the change.

Drainage area of a stream at a specific location is that area, measured in a horizontal plane, enclosed by a topographic divide from which direct surface runoff from precipitation normally drains by gravity into the stream above the specified point. Figures of drainage area given herein include all closed

basins, or noncontribution areas, within the area unless otherwise noted.

Drainage basin is a part of the surface of the earth that is occupied by a drainage system, which consists of a surface stream or a body of impounded surface water together with all tributary surface stream and bodies of impounded surface water.

Gage height (G.H.) is the water-surface elevation referred to some arbitrary gage datum. Gage height is often used interchangeably with the more general term “stage,” although gage height is more appropriate when used with a reading on a gage.

Gaging station is a particular site on a stream, canal, lake, or reservoir where systematic observations of hydrologic data are obtained.

Hardness of water is a physical-chemical characteristic that is commonly recognized by the increased quantity of soap required to produce lather. It is attributable to the presence of alkaline earths (principally calcium and magnesium) and is expressed as the equivalent concentration of calcium carbonate (CaCO_3).

Hydrologic benchmark station is one that provides hydrologic data for a basin in which the hydrologic regimen will likely be governed solely by natural conditions. Data collected at a benchmark station may be used to separate effects of natural from human-induced changes in other basins that have been developed and in which the physiography, climate, and geology are similar to those in the undeveloped benchmark basin.

Hydrologic index stations in this report, refers to four continuous record gaging stations that have been selected as representative of streamflow patterns for their respective regions of Ohio. Station locations are shown in figure 2.

Hydrologic unit is a geographic area representing part or all of a surface drainage basin or distinct hydrologic feature as delineated by the Office of Water Data Coordination on the State Hydrologic Unit Maps; each hydrologic unit is identified by an 8-digit number.

Land-surface datum (lsd) is a datum plane that is approximately at land surface at each ground-water observation well.

Measuring point (MP) is an arbitrary permanent reference point from which the distance to the water surface in a well is measured to obtain the water level.

Metamorphic stage refers to the stage of development that an organism exhibits during its transformation from an immature form to an adult form. This developmental process exists for most insects, and the degree of difference from the immature stage to the adult form varies from relatively slight to pronounced, with many intermediates. Examples of metamorphic stages of insects are egg-larva-adult or egg-nymph-adult.

Methylene blue active substance (MBAS) is a measure of apparent detergents. This determination depends on the formation of a blue color when methylene blue dye reacts with synthetic anionic detergent compounds.

Microgram per kilogram (UG/KG, $\mu\text{g}/\text{kg}$) is a unit expressing the concentration of a chemical element as the mass (micrograms) of the element sorbed per unit mass (kilogram) of bottom material.

Micrograms per gram (UG/G, $\mu\text{g}/\text{g}$) is a unit expressing the concentration of a chemical element as the mass (micrograms) of the element sorbed per unit mass (gram) of sediment.

Micrograms per liter (UG/L, $\mu\text{g}/\text{L}$) is a unit expressing the concentration of chemical constituents in solution as mass (micrograms) of solute per unit volume (liter) of water. One thousand micrograms per liter is equivalent to one milligram per liter.

Milligrams per liter (MG/L, mg/L) is a unit for expressing the concentration of chemical constituents in solution. Milligrams per liter represent the mass of solute per unit volume (liter) of water.

Concentration of suspended sediment also is expressed in milligrams per liter, and is based on the mass of dry sediment per liter of water-sediment mixture.

Miscellaneous site, or miscellaneous station, is a site where streamflow, sediment, and/or water-quality data are collected once, or more often on a random or discontinuous basis.

National Geodetic Vertical Datum of 1929 (NGVD of 1929) is a geodetic datum derived from a general adjustment of the first order level nets of the United States and Canada. It was formerly called “Sea

Level Datum of 1929" or "mean sea level" in this series of reports. Although the datum was derived from the average sea level over a period of many years at 26 tide stations along the Atlantic, Gulf of Mexico, and Pacific Coasts, it does not necessarily represent local mean sea level at any particular place. See NOAA web site: <http://www.ngs.noaa.gov/faq.shtml#WhatVD29VD88>

North American Vertical Datum of 1988 (NAVD of 1988) is the vertical control datum established in 1991 by the minimum-constraint adjustment of the Canadian-Mexican-U.S. leveling observations. It held fixed the height of the primary tidal bench mark, referenced to the new International Great Lakes Datum of 1985 local mean sea level height value, at Father Point/Rimouski, Quebec, Canada.

Organic carbon (OC) is a measure of organic matter present in aqueous solution, suspension, or bottom sediments. May be reported as dissolved organic carbon (DOC), suspended organic carbon (SOC), or total organic carbon (TOC).

Organism is any living entity.

Organism count/area refers to the number of organisms collected and enumerated in a sample and adjusted to the number per unit area of habitat, usually square meters (m^2), acres, or hectares. Periphyton benthic organisms and macrophytes are expressed in these terms.

Organism count/volume refers to the number of organisms collected and enumerated in a sample and adjusted to the number per sample volume, usually milliliters (mL) or liters (L). Numbers of planktonic organisms can be expressed in these terms.

Total organism count is the total number of organisms collected and enumerated in any particular sample.

Parameter code is a 5-digit number used in the U.S. Geological Survey's data system, the National Water Information System (NWIS), to uniquely identify a specific constituent. The codes used in NWIS are the same as those used in the U.S. Environmental Protection Agency's data system, STORET.

Partial-record station is a particular site where limited streamflow and (or) water-quality data are collected systematically over a period of years for use in hydrologic analyses.

Particle size is the diameter, in millimeters (mm), of suspended sediment or bed material determined by either sieve or sedimentation methods. Sedimentation methods determine fall diameter of particles in either distilled water (chemically dispersed) or in native water (the river water at the time and point of sampling).

Particle-size classification used in this report agrees with recommendations made by the American Geophysical Union Subcommittee on Sediment Terminology.

| Classification | Size (millimeters) | Method of analysis |
|-----------------------|-------------------------------|-------------------------------|
| Clay | 0.00024-0.004 | Sedimentation |
| Silt | 0.004-0.062 | Sedimentation |
| Sand | 0.062-2.0 | Sedimentation or sieve |
| Gravel | 2.0-64.0 | Sieve |

The particle-size distributions given in this report are not necessarily representative of all particles in transport in the stream. Most of the organic material is removed and the sample is subjected to mechanical and chemical dispersion before analysis in distilled water. Chemical dispersion is not used for native-water analysis.

Percent composition is a unit for expressing the ratio of a particular part of a sample or population to the total sample or population in terms of types, number, mass, or volume.

Periphyton is the assemblage of microorganisms attached to and growing upon solid surfaces. While primarily consisting of algae, they also include bacteria, fungi, protozoa, rotifers, and other small organisms. Periphyton is a useful indicator of water quality.

pH of water is the negative logarithm of the hydrogen-ion activity. Solutions with pH less than 7 are termed "acidic," and solutions with a pH greater than 7 are termed "basic." Solutions with a pH of 7

are neutral. The presence and concentration of many dissolved chemical constituents found in water are, in part, influenced by the hydrogen-ion activity of water. Biological processes including growth, distribution of organisms, and toxicity of the water to organisms are also influenced, in part, by the hydrogen-ion activity of water.

Pesticides are chemical compounds used to control undesirable plants and animals. Major categories of pesticides include insecticides, miticides, fungicides, herbicides, and rodenticides. Insecticides and herbicides, which control insects and plants respectively, are the two categories reported.

Picocurie (PCI, pCi) is one trillionth (1×10^{-12}) of the amount of radioactivity represented by a curie (Ci). A curie is the amount of radioactivity that yields 3.7×10^{10} radioactive disintegrations per second. A picocurie yields 2.22 dpm (disintegrations per minute).

Plankton is the community of suspended, floating, or weakly swimming organisms that live in the open water of lakes and rivers.

Phytoplankton is the plant part of the plankton. They are usually microscopic, and their movement is subject to the water currents. Phytoplankton growth is dependent upon solar radiation and nutrient substances. Because they are able to incorporate as well as release materials to the surrounding water, the phytoplankton have a profound effect upon the quality of the water. They are the primary food producers in the aquatic environment, and are commonly known as algae.

Blue-green algae are a group of phytoplankton organisms having a blue pigment, in addition to the green pigment called chlorophyll. Blue-green algae often cause nuisance conditions.

Diatoms are the unicellular or colonial algae having a siliceous shell. Their concentrations are expressed as number of cells per milliliter (cells/mL) of sample.

Green algae have chlorophyll pigments similar in color to those of higher green plants.

Some forms produce algae mats or floating "moss" in lakes. Their concentrations are expressed as number of cells per milliliters (cells/mL) of sample.

Zooplankton is the animal part of the plankton. Zooplankton are capable of extensive movement within the water column and are often large enough to be seen with the unaided eye.

Zooplankton are secondary consumers feeding upon bacteria, phytoplankton, and detritus. Because they are the grazers in the aquatic environment, the zooplankton are a vital part of the aquatic food web. The zooplankton community is dominated by small crustaceans and rotifers.

Primary productivity is a measure of the rate at which new organic matter is formed and accumulated through photosynthetic and chemosynthetic activity of producer organisms (chiefly, green plants). The rate of primary production is estimated by measuring the amount of oxygen released (oxygen method) or the amount of carbon assimilated by the plants (carbon method).

Milligrams of carbon per area or volume per unit time [$\text{mg C}/(\text{m}^2 \text{ or } \text{m}^3/\text{time})$] for periphyton, macrophytes, and phytoplankton are units for expressing primary productivity. They define the amount of carbon dioxide consumed as measured by radioactive carbon (carbon-14). The carbon-14 method is of greater sensitivity than the oxygen light and dark bottle method, and it is preferred for use in unenriched waters. Unit time may be the hour or day, depending on the incubation period.

Milligrams of oxygen per area or volume per unit time [$\text{mg O}_2/(\text{m}^2 \text{ or } \text{m}^3/\text{time})$] for periphyton, macrophytes, and phytoplankton are units for expressing primary productivity. They define production and respiration rates as estimated from changes in the measured dissolved oxygen concentration. The oxygen light and dark bottle method is preferred if the rate of primary production is sufficient for accurate measurements to be made within 24 hours. Unit time may be either the hour or day, depending on the incubation period.

Recoverable from bottom material is the amount of a given constituent that is in solution after a representative sample of bottom material has been digested by a method (usually using an acid or mixture of acids) that results in dissolution of only readily soluble substances. Complete dissolution of all bottom material is not achieved by the digestion treatment; thus, the determination represents

less than the total amount (that is, less than 95 percent) of the constituent in the sample. To achieve comparability of analytical data, equivalent digestion procedures would be required of all laboratories performing such analyses because different digestion procedures are likely to produce different analytical results.

Recurrence interval is the average time interval between occurrences of a hydrological event of a given or greater magnitude, usually expressed in years. May also be called return period.

Runoff in inches (IN., in.) indicates the depth to which the drainage area would be covered if all the runoff for a given time period were uniformly distributed on it.

Sea level refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929)—a geodetic datum derived from a general adjustment of the first-order level nets of both the United States and Canada, formerly called Sea Level Datum of 1929.

Sediment is solid material that originates mostly from disintegrated rocks and is transported by, suspended in, or deposited from water; it includes chemical and biochemical precipitates and decomposed organic material such as humus. The quantity, characteristics, and cause of the occurrence of sediment in streams are influenced by environmental factors. Some major factors are degree of slope, length of slope, soil characteristics, land use, and quantity and intensity of precipitation.

Bed load is the sediment that is transported in a stream by rolling, sliding, or skipping along the bed and very close to it. In this report, bed load is considered to consist of particles in transit within 0.25 ft of the streambed.

Bed-load discharge (tons per day) is the quantity of bed load measured by dry weight that moves past a section as bed load in a given time.

Suspended sediment is the sediment that at any given time is maintained in suspension by the upward components of turbulent currents or that exists in suspension as a colloid.

Suspended-sediment concentration is the velocity-weighted concentration of suspended sediment in the sampled zone (from the water surface to a point approximately 0.3 ft above the bed) expressed as milligrams of dry sediment per liter of water-sediment mixture (mg/L).

Suspended-sediment discharge (ton/day) is the rate at which dry weight of sediment passes a section of a stream or is the quantity of sediment, as measured by dry weight or volume, that passes a section in a given time. It is computed by multiplying discharge times mg/L times 0.0027.

Suspended-sediment load is the quantity of suspended sediment passing a section in a specified period.

Total sediment discharge (ton/day) is the sum of the suspended-sediment discharge and the bed-load discharge. It is the total quantity of sediment, as measured by dry weight or volume, that passes a section during a given time.

Mean concentration is the time-weighted concentration of suspended sediment passing a stream section during a 24-hour day.

Seven-day, 10-year low flow ($7Q_{10}$) is the discharge at the 10-year recurrence interval taken from a frequency curve of annual values of the lowest mean discharge for 7 consecutive days (the 7-day low flow).

Sodium-adsorption-ratio (SAR) is the expression of relative activity of sodium ions in exchange reactions within soil and is an index of sodium or alkali hazard to the soil. Waters range in respect to sodium hazard from those which can be used for irrigation on almost all soils to those which are generally unsatisfactory for irrigation.

Solute is any substance derived from the atmosphere, vegetation, soil, or rocks that is dissolved in water.

Specific conductance is a measure of the ability of a water to conduct an electrical current. It is expressed in microsiemens per centimeter at 25°C. Specific conductance is related to the type and concentration of ions in solution and can be used for approximating the dissolved-solids content of the water.

Commonly, the concentration of dissolved solids (in milligrams per liter) is about 65 percent of the

specific conductance (in microsiemens). This relation is not constant from stream to stream, and it may vary in the same source with changes in the composition of the water.

Stage-discharge relation is the relation between gage height (stage) and volume of water, per unit of time, flowing in a channel.

Streamflow is the discharge that occurs in a natural channel. Although the term “discharge” can be applied to the flow of a canal, the word “streamflow” uniquely describes the discharge in a surface stream course. The term “streamflow” is more general than “runoff,” because streamflow may be applied to discharge whether or not it is affected by diversion or regulation.

Substrate is the physical surface upon which an organism lives.

Natural substrate refers to any naturally occurring emerged or submersed solid surface, such as a rock or tree, upon which an organism lives.

Artificial substrate is a device that is purposely placed in a stream or lake for colonization of organisms. The artificial substrate simplifies the community structure by standardizing the substrate from which each sample is taken. Examples of artificial substrate are basket samplers (made of wire cages filled with clean streamsize rocks) and multiplate samplers (made of hardboard) for benthic organism collection and plexiglas strips for periphyton.

Surface area of a lake is that area outlined on the latest USGS topographic map as the boundary of the lake and measured by a planimeter or a digitizer, in acres. In localities not covered by topographic maps, the areas are computed from the best maps available at the time planimetered or digitized. All areas shown are those for the stage when the planimetered map was made.

Surficial bed material is the part (0.1 to 0.2 ft) of the bed material that is sampled using U.S. Series Bed-material Samplers.

Suspended (as used in tables of chemical analyses) refers to the amount (concentration) of the total concentration in a water-sediment mixture. The water-sediment mixture is associated with (or sorbed on) that material retained on a 0.45-micrometer filter.

Suspended, recoverable is the amount of a given constituent that is in solution after the part of a representative water-suspended sediment sample that is retained on a 0.45-micrometer membrane filter has been digested by a method (usually using a dilute acid solution) that results in dissolution of only readily soluble substances. Complete dissolution of all the particulate matter is not achieved by the digestion treatment, and thus the determination represents something less than the “total” amount (that is, less than 95 percent) of the constituent present in the sample. To achieve comparability of analytical data, equivalent digestion procedures would be required of all laboratories performing such analyses because different digestion procedures are likely to produce different analytical results. Determinations of “suspended, recoverable” constituents are made either by analyzing portions of the material collected on the filter or, more commonly, by difference, based on determinations of (1) dissolved and (2) total recoverable concentrations of the constituent.

Suspended, total is the total amount of a given constituent in the part of a representative water-suspended sediment sample that is retained on a 0.45-micrometer membrane filter. This term is used only when the analytical procedure assures measurement of at least 95 percent of the constituent determined. A knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to determine when the results should be reported as “suspended, total.” Determinations of “suspended, total” constituents are made either by analyzing portions of the material collected on the filter or, more commonly, by difference, based on determinations of (1) dissolved and (2) total concentrations of the constituent.

Taxonomy is the division of biology concerned with the classification and naming of organisms. The classification of organisms is based upon a hierachial scheme beginning with Kingdom and ending with Species at the base. The higher the classification level, the fewer features the organisms have in

common. For example, the taxonomy of a particular mayfly, *Hexagenia limbata*, is the following:

| | |
|---------------|--------------------------|
| Kingdom | Animal |
| Phylum..... | Arthropoda |
| Class | Insecta |
| Order..... | Ephemeroptera |
| Family..... | Ephemeridae |
| Genus..... | <i>Hexagenia</i> |
| Species..... | <i>Hexagenia limbata</i> |

Time-weighted average is computed by multiplying the number of days in the sampling period by the concentrations of individual constituents for the corresponding period and dividing the sum of the products by the total number of days. A time-weighted average represents the composition of water that would be contained in a vessel or reservoir that had received equal quantities of water from the stream each day for the year.

Tons per acre-foot indicates the dry mass of dissolved solids in 1 acre-foot of water. It is computed by multiplying the concentration of the constituent, in milligrams per liter, by 0.00136.

Tons per day (T/DAY) is the quantity of substance in solution or suspension that passes a stream section during a 24-hour day.

Total is the total amount of a given constituent in a representative water-suspended sediment sample, regardless of the constituent's physical or chemical form. This term is used only when the analytical procedure assures measurement of at least 95 percent of the constituent present in both the dissolved and suspended phases of the sample. A knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to judge when the results should be reported as "total." (Note that the word "total" does double duty here, indicating both that the sample consists of a water-suspended sediment mixture and that the analytical method determines all of the constituent in the sample.)

Total in bottom material is the total amount of a given constituent in a representative sample of bottom material. This term is used only when the analytical procedure assures measurement of at least 95 percent of the constituent determined. A knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to judge when the results should be reported as "total in bottom material."

Total discharge is the total quantity of any individual constituent, as measured by dry mass or volume, that passes through a stream cross section per unit of time. This term needs to be qualified, such as "total sediment discharge," "total chloride discharge," and so on.

Total load (tons) is the total quantity of any individual constituent, as measured by dry mass or volume, that is dissolved in a specific amount of water (discharge) during a given time. It is computed by multiplying the total discharge, times the concentration of the constituent (in milligrams per liter), times the factor 0.0027, times the number of days.

Total recoverable is the amount of a given constituent that is in solution after a representative water-suspended sediment sample has been digested by a method (usually using a dilute acid solution) that results in dissolution of only readily soluble substances. Complete dissolution of all particulate matter is not achieved by the digestion treatment, and thus the determination represents something less than the "total" amount (that is, less than 95 percent) of the constituent present in the dissolved and suspended phases of the sample. To achieve comparability of analytical data, equivalent digestion procedures would be required of all laboratories performing such analyses because different digestion procedures are likely to produce different analytical results.

Turbidity is a measurement of the collective optical properties of a water sample that cause light to be scattered and absorbed rather than transmitted in straight lines; the higher the intensity of scattered light, the higher the turbidity. Turbidity is expressed in nephelometric turbidity units (NTU) or

Formazin turbidity units (FTU) depending on the method and equipment used.

Water year in USGS reports dealing with surface-water supply is the 12-month period October 1 through September 30. The water year is designated by the calendar year in which it ends and which includes 9 of the 12 months. Thus, the year ending September 30, 1980, is called water year 1980.

WDR is used as an abbreviation for “Water-Data Report” in the REVISED RECORDS paragraph to refer to state annual basic-data reports published after 1975.

Weighted average is used in this report to indicate discharge-weighted average. It is computed by multiplying the discharge for a sampling period by the concentrations of individual constituents for the corresponding period and dividing the sum of the products by the sum of the discharges. A discharge-weighted average approximates the composition of water that would be found in a reservoir containing all the water passing a given location during the water year after thorough mixing in the reservoir.

Well is an excavation (pit, hole, tunnel), generally cylindrical in form and often walled in, drilled, dug, driven, bored, or jetted into the ground to such a depth as to penetrate water-yielding geologic material and allow the water to flow or to be pumped to the surface.

WRD is used as an abbreviation for “Water-Resources Data” in the REVISED RECORDS paragraph to refer to state annual basic-data reports published before 1975.

WSP is used as an abbreviation for “Water-Supply Paper” in references to previously published reports.

PUBLICATIONS ON TECHNIQUES OF WATER-RESOURCES INVESTIGATIONS

The U.S. Geological Survey publishes a series of manuals describing procedures for planning and conducting specialized work in water-resources investigations. The material is grouped under major subject headings called books and is further divided into sections and chapters. For example, Section A of Book 3 (Applications of Hydraulics) pertains to surface water. The chapter, the unit of publication, is limited to a narrow field of subject matter. This format permits flexibility in revision and publication as the need arises.

The reports listed below are for sale by the U.S. Geological Survey, Branch of Information Services, Box 25286, Federal Center, Denver, CO 80225 (authorized agent of the Superintendent of Documents, Government Printing Office). Prepayment is required. Prices are not included because they are subject to change. Current prices can be obtained by writing to the above address. When ordering or inquiring about prices for any of these publications, please give the title, book number, chapter number, and “U.S. Geological Survey Techniques of Water-Resources Investigations.”

SURFACE-WATER RECORDS
Ottawa River Basin

04177000 OTTAWA RIVER AT UNIVERSITY OF TOLEDO, TOLEDO, OHIO

LOCATION.—Latitude 41°39'29", longitude 83°37'19", in NE 1/4 sec. 32, T.9 S., R.7 E., Lucas County, Hydrologic Unit 04100001, on left bank at auto bridge at University of Toledo, Toledo, Ohio, 0.4 mi downstream from Deline Ditch, 5.6 mi upstream from Sibley Creek, and 10.9 mi upstream from mouth.

DRAINAGE AREA.—150 mi². Area at site used prior to Sept 30, 1948, 150 mi², revised.

PERIOD OF RECORD.—March 1945 to September 1948 (published as "Tenmile Creek at Toledo"), August 1976 to current year.

REVISED RECORDS.—WSP 1307: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 576.28 ft above sea level. (From Aug. 1976 to July, 1979, at site 500 ft downstream. Prior to

Sept. 30, 1948, water-stage recorder at site 2,500 ft upstream at datum 3.72 ft higher.

REMARKS.—Records fair except for May 21-June 13 and for periods of estimated record, which are poor. Water-quality data formerly collected at this site.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood of June 1, 1943, reached a stage of 15.1 ft present datum, from floodmark, Lucas County Sanitary Engineers; discharge, 3,400 ft³/s. Flood of Apr. 25, 1950, reached a stage of 15.0 ft present datum, from floodmark; discharge, 3,300 ft³/s.

SURFACE-WATER RECORDS
Maumee River Basin

39

04185000 TIFFIN RIVER AT STRYKER, OHIO

LOCATION.—Latitude 41°30'16", longitude 84°25'47", in SE 1/4 sec. 5, T.6 N., R.4 E., Williams County, Hydrologic Unit 04100006, on left bank 0.5 mi downstream from bridge on State Highway 191 at west edge of Stryker, Ohio, 0.6 mi upstream from Penn Central bridge, and 1.6 mi downstream from Leatherwood Creek.

DRAINAGE AREA.—410 mi².

PERIOD OF RECORD.—September 1921 to September 1928 (published as "near Stryker"), October 1940 to current year.

REVISED RECORDS.—WSP 1144: 1922-28. WSP 1387: 1925. WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 685.1 ft above sea level. Prior to Sep. 30, 1928, nonrecording gage at site 3.5 mi downstream at different datum. Oct. 13, 1940 to Jan. 17, 1941, nonrecording gage and Jan. 18, 1941 to Sep. 30, 1953, water-stage recorder, at site 0.5 mi downstream at same datum.

REMARKS.—Records fair except for periods of estimated record, which are poor. Small diversion 12.5 mi upstream from gage for municipal supply of Archbold. Diversion averaged 2.93 ft³/s; returned as sewage to Brush Creek, which flows into Tiffin River about 15 mi downstream from station. Water-quality and sediment data formerly collected at this site.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood in March 1913 reached a stage of 16.0 ft, from floodmarks; discharge, 7,600 ft³/s. Flood in 1937 reached a stage of 15.0 ft, from information by local resident; discharge, 6,000 ft³/s.

SURFACE-WATER RECORDS
Maumee River Basin

04186500 AUGLAIZE RIVER NEAR FORT JENNINGS, OHIO

LOCATION.—Latitude 40°56'55", longitude 84°15'58", in SE 1/4 sec. 15, T.1 S., R.5. E., Putnam County, Hydrologic Unit 04100007, on left bank 200 ft upstream from bridge on U. S. Highway 224, 3.5 mi northeast of Fort Jennings, Ohio, 6 mi upstream from Ottawa River, and 7.3 mi downstream from Jennings Creek.

DRAINAGE AREA.—332 mi².

PERIOD OF RECORD.—August 1921 to December 1935. October 1940 to current year.

REVISED RECORDS.—WSP 744: 1932. WSP 974: 1930(M). WSP 1307: 1922-24(M), 1926-27(M), 1929(M). WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 713.6 ft above sea level. Prior to Oct. 6, 1930, nonrecording gage at same site and datum.

REMARKS.—Records fair except for periods of estimated record, which are poor. Beginning Jan. 4, 1971, water was diverted at a point 24.3 mi upstream from station into Lake Bresler. Storage in Lake Bresler is available for low-flow augmentation and water supply of city of Lima, in Ottawa River Basin. Net withdrawal totaled 4,502 million gallons, equivalent to a mean withdrawal of 15.0 ft³/s. No releases have been made for low-flow augmentation. Some diversion from Grand Lake to Auglaize River Basin through Miami and Erie Canal into Jennings Creek at a point 9.2 mi upstream from station. Annual figures of runoff are considered to be within 10 percent of natural yield. Water-quality and sediment data formerly collected at this site. National Weather Service gage height telemeter at station.

SURFACE-WATER RECORDS
Maumee River Basin

04189000 BLANCHARD RIVER NEAR FINDLAY, OHIO

LOCATION.—Latitude 41°03'21", longitude 83°41'17", on east line of sec. 10, T.1 N., R.10 E., Hancock County, Hydrologic Unit 04100008, on left bank at upstream side of county road bridge, 2 mi west of Findlay, Ohio, 3 mi downstream from Eagle Creek, and 3 mi upstream from Aurand Run.

DRAINAGE AREA.—346 mi².

PERIOD OF RECORD.—October 1923 to December 1935, October 1940 to current year. Monthly discharge only for October 1923, published in WSP 1307.

REVISED RECORDS.—WSP 974: 1942. WSP 1054: 1927-30, 1933(M), 1945. WSP 1387: 1926, 1928(M), 1930(M), 1952. WSP 1912: Drainage area. WRD-OH-81-2: 1959, 1975(M). WRD-OH-97-2: 1996(M).

GAGE.—Water-stage recorder. Datum of gage is 753.65 ft above sea level (North American Vertical Datum of 1988). Prior to July 24, 1930, nonrecording gage at same site and datum.

REMARKS.—Records fair except for periods of estimated record, which are poor. Water is diverted upstream from station into Findlay Reservoir. Storage in Findlay Reservoir used for water supply of city of Findlay and is available for low-flow augmentation. All water returns to stream upstream from station. Water-quality and sediment data formerly collected at this site.

SURFACE-WATER RECORDS
Maumee River Basin

43

04191500 AUGLAIZE RIVER NEAR DEFIANCE, OHIO

LOCATION.—Latitude 41°14'15", longitude 84°23'57", in NE 1/4 sec. 9, T.3 N. R.4 E., Defiance County, Hydrologic Unit 04100007, on right bank 125 ft downstream from City of Bryant hydroelectric dam, 0.2 mi upstream from Jackson Ditch, and 3 mi south of Defiance, Ohio.

DRAINAGE AREA.—2,318 mi².

PERIOD OF RECORD.—May to August 1903 (gage heights only), April 1915 to current year. Monthly discharges only for some periods, published in WSP 1307.

REVISED RECORDS.—WSP 954: 1941. WSP 1912: Drainage area, WRD OH-72-1: 1966(M).

GAGE.—Water-stage recorder. Datum of gage is 659.70 ft above sea level. May 20 to Aug. 8, 1903, non-recording gage at site 1.8 mi downstream at different datum. Apr. 13, 1915, to Dec. 6, 1933, nonrecording gage near right bank on downstream side of dam at datum 6.00 ft higher, and auxiliary tailwater staff gage near right bank on downstream side of dam at present datum. Oct. 1982 to Nov. 1984 at dam 125 ft upstream, at present datum.

REMARKS.—Records fair. Flow regulated by dam at powerplant at station; reservoir capacity, 9,800 acre-ft. Plant shut down except for occasional gate operation, Jan. 10, 1963 to Sep. 7, 1985. Some diversion by Miami and Erie Canal from Grand Lake into Jennings Creek, tributary to Auglaize River 70 mi upstream from station. Water-quality data formerly collected at this site.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood of March 1913 reached a stage of 38.8 ft, from reading on powerplant tailwater gage at present datum; discharge, 120,000 ft³/s, from rating curve extended above 51,000 ft³/s.

SURFACE-WATER RECORDS
Maumee River Basin

04192500 MAUMEE RIVER NEAR DEFIANCE, OHIO

LOCATION.—Latitude 41°17'31", longitude 84°16'52", in NW 1/4 sec. 22, T.4 N., R.5 E., Defiance County, Hydrologic Unit 04100009, on left bank 40 ft upstream from Independence Dam, 4 mi downstream from mouth of Auglaize River, and 4.5 mi east of Defiance, Ohio.
DRAINAGE AREA.—5,545 mi².

WATER-DISCHARGE RECORDS

PERIOD OF RECORD.—October 1924 to December 1935, March 1939 to September 1974, October 1978 to current year.

REVISED RECORDS.—WSP 974: 1926-27, 1930, WSP 1387: 1925-28, 1946. WRD Ohio, 1970: Drainage Area.

GAGE.—Water-stage recorder. Datum of gage is 658.56 ft above sea level. Prior to Nov. 13, 1924, nonrecording gage at same site and datum.

REMARKS.—Records good except for periods estimated record, which are poor. Flow affected by regulation of Auglaize River at hydroelectric plant of the Hydro-Corporation, 7 mi upstream. Operation of hydroelectric plant there was discontinued Jan. 10, 1963, to Sep. 7, 1985. Low flow slightly regulated by powerplant at Ft. Wayne, Indiana. Slight diversion 275 ft upstream into Miami and Erie Canal through a 24-inch conduit, which bypasses station. Two 36-inch diversion pipes installed at dam in 1998 for low-flow augmentation. Water-quality and sediment data collected at this site.

WATER-QUALITY RECORDS

PERIOD OF RECORD.—January 1997 to September 2000 (discontinued).

PERIOD OF DAILY RECORD.—

SUSPENDED SEDIMENT DISCHARGE: January 1997 to September 2000 (discontinued).

INSTRUMENTATION.—Sampler located downstream from streamflow-gaging station, at Florida, Ohio.

REMARKS.—Sediment samples were collected by a local observer on an approximate once daily basis. Sediment loads were calculated using the mean-interval method (Porterfield, George, 1972, Computation of Fluvial-Sediment Discharge: U.S. Geological Survey, Techniques of Water-Resources Investigations, Book 3, Chap. C3, 66 p.). For days with unsteady concentration, discharge, or both, the day was subdivided into hourly intervals and the daily load was calculated by summation of hourly loads. This required interpolation between measured and estimated concentrations.

EXTREMES FOR PERIOD OF DAILY RECORD.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 1,340 mg/L, Feb. 28, 1997; minimum daily mean, 2 mg/L, Dec. 6 and 7, 1999.

SEDIMENT LOADS: Maximum daily, 201,000 tons, Feb. 28, 1997; minimum daily, 1.9 tons, Dec. 6, 1999.

EXTREMES FOR CURRENT YEAR.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 857 mg/L, Apr. 21; minimum daily mean, 2 mg/L, Dec. 6 and 7.

SEDIMENT LOADS: Maximum daily, 55,900 tons, Apr. 21; minimum daily, 1.9 tons, Dec. 6.

SURFACE-WATER RECORDS
Maumee River Basin

04193500 MAUMEE RIVER AT WATERVILLE, OHIO

LOCATION.—Latitude 41°30'00", longitude 83°42'46", Lucas County, Hydrologic Unit 04100009, on downstream side of first pier from left end of bridge on State Highway 64 at Waterville, Ohio, 3 mi downstream from Tontogany Creek, and 20.7 mi upstream from mouth.
DRAINAGE AREA.—6,330 mi².

WATER-DISCHARGE RECORDS

PERIOD OF RECORD.—November 1898 to December 1901, August 1921 to December 1935, March 1939 to current year. Miami and Erie Canal flow included at Waterville prior to 1930, when the canal was abandoned.

REVISED RECORDS.—WSP 894: 1930(M). WSP 1084: 1946. WSP 1387: 1900(M), 1922-23, 1933. WDR OH-68-1: 1967. WDR OH-70-1: Drainage area. WRD-OH-82-2: 1981.

GAGE.—Water-stage recorder with auxiliary crest-stage gage. Datum of gage is 595.71 ft above sea level. Nov. 19, 1898 to Dec. 31, 1901, Aug. 26, 1921, to July 31, 1930, nonrecording gage; Aug. 1, 1930, to Dec. 31, 1935, water-stage recorder; Mar. 14, 1939, to Mar. 12, 1940, nonrecording gage at same site and datum.

REMARKS.—Records good except for periods of estimated record, which are poor. Satellite telemeter at station. Water-quality and sediment data collected at this site.

EXTREMES FOR PERIOD OF RECORD.—Practically no flow at times prior to June 30, 1929, when entire river flow was being diverted by canal.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood in March 1913 reached a stage of 19.9 ft, from information by local resident; estimated discharge, 180,000 ft³/s, from rating curve extended above 94,000 ft³/s.

SURFACE-WATER RECORDS
Maumee River Basin

04193500 MAUMEE RIVER AT WATERVILLE, OHIO—Continued

WATER-QUALITY RECORDS

PERIOD OF RECORD.—April 1950 to current year.

PERIOD OF DAILY RECORD.—

CHLORIDE: October 1987 to September 1994.

NITROGEN, NITRITE + NITRATE: October 1987 to September 1994.

NITROGEN, AMMONIA + ORGANIC: October 1987 to September 1994.

PHOSPHORUS: October 1987 to September 1994.

SUSPENDED SEDIMENT DISCHARGE: April 1950 to September 1984. October 1987 to current year.

INSTRUMENTATION.—Refrigerated water-quality pumping sampler, operated by Heidelberg College Water Quality Laboratory, from October 1987 to September 1994. Sampler located at station 04193490.

REMARKS.—Sediment samples were collected by a local observer on an approximate once daily basis. Sediment loads were calculated using the mean-interval method (Porterfield, George, 1972, Computation of Fluvial-Sediment Discharge: U.S. Geological Survey, Techniques of Water-Resources Investigations, Book 3, Chap. C3, 66 p.). For days with unsteady concentration, discharge, or both, the day was subdivided into hourly intervals and the daily load was calculated by summation of hourly loads. This required interpolation between measured and estimated concentrations.

EXTREMES FOR PERIOD OF DAILY RECORD.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 2,240 mg/L, Mar. 26, 1954; minimum daily mean, 1 mg/L, on many days during 1953, 1955, and 1963.

SEDIMENT LOADS: Maximum daily mean, 300,000 tons, Feb. 24, 1990; minimum daily mean, 0.26 ton, Sep. 18, 1955.

EXTREMES FOR CURRENT YEAR.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 811 mg/L, Apr. 22; minimum daily mean, 4 mg/L, Oct. 19, Nov. 17, 18, Dec. 6 and 7.

SEDIMENT LOADS: Maximum daily mean, 75,300 tons, Apr. 22; minimum daily mean, 3.4 tons Nov. 17.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

SURFACE-WATER RECORDS
Portage River Basin

53

04195500 PORTAGE RIVER AT WOODVILLE, OHIO

LOCATION.—Latitude 41°26'58", longitude 83°21'41", in sec. 28, T.6 N., R.13 E., Sandusky County, Hydrologic Unit 04100010, on left bank at upstream side of bridge on U.S. Highway 20 in Woodville, Ohio, 600 ft downstream from unnamed right bank tributary, and 10.3 mi upstream from Sugar Creek.

DRAINAGE AREA.—428 mi².

PERIOD OF RECORD.—July 1928 to December 1935, October 1939 to current year.

REVISED RECORDS.—WSP 894: 1929-30. WSP 1207: 1933. WSP 1387: 1931, 1933. WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 614.75 ft above sea level. Prior to Oct. 8, 1933, nonrecording gage, Oct. 9, 1933, to Dec. 30, 1935, water-stage recorder, Oct. 17 to Nov. 29, 1939, nonrecording gage, all at same site and datum.

REMARKS.—Records good except for periods of estimated record, which are poor. Flow supplemented by water imported from Maumee River Basin for municipal supply for city of Bowling Green 16 mi upstream. The importation of this water began Sept. 1, 1951. Water-quality data formerly collected at this site 800 ft downstream. Sediment data formerly collected at this site. National Weather Service gage height telemeter at station.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood in March 1913 reached a stage of 17 ft, from information by local residents; discharge, 17,000 ft³/s, from rating curve extended above 11,500 ft³/s.

e Estimated.

Adjusted for diversion.

(+) Diversion in cubic feet per second, from Maumee River Basin for municipal supply; furnished by City of Bowling Green.

SURFACE-WATER RECORDS
Portage River Basin

04195820 PORTAGE RIVER AT ELMORE, OHIO

LOCATION.—Latitude 41°29'28", longitude 83°13'29", Ottawa County, Hydrologic Unit 04100010, on right bank 500 ft upstream from State Route 590, 0.4 mi upstream from Sugar Creek, and 4.2 mi east of Elmore.

DRAINAGE AREA.—494 mi².

PERIOD OF RECORD.—August 1998 to current year.

GAGE.—Water-stage recorder. Datum of gage is 576 ft above sea level.

REMARKS.—Records fair except for periods of estimated record, which are poor. Flow supplemented by water imported from Maumee River Basin for municipal supply for city of Bowling Green 30 mi upstream. The importation of this water began Sept. 1, 1951.

a Peaks above base shown in table of peak discharges and stages at continuous-record surface-water-discharge stations.

e Estimated.

≠ Adjusted for diversion.

(+) Diversion in cubic feet per second, from Maumee River Basin for municipal supply; furnished by City of Bowling Green.

SURFACE-WATER RECORDS
Sandusky River Basin

55

04196000 SANDUSKY RIVER NEAR BUCYRUS, OHIO

LOCATION.—Latitude 40°48'13", longitude 83°00'21", in NE 1/4 sec. 10, T.3 S., R.16 E., Crawford County, Hydrologic Unit 04100011, on right bank at downstream side of bridge on township road, 1 mi upstream from unnamed left bank tributary, 1.5 mi west of Bucyrus, Ohio, and 12 mi downstream from Loss Creek.

DRAINAGE AREA.—88.8 mi².

PERIOD OF RECORD.—August 1925 to November 1935, July 1938 to December 1951, December 1963 to September 1981, October 1995 to current year.

REVISED RECORDS.—WSP 744: 1925-32. WSP 874: 1938. WSP 1307: 1926(M), 1928(M), 1931, 1932(M), 1934-35(M), 1939, 1940(M), 1946(M). WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 955.04 ft above sea level. Prior to May 11, 1940, nonrecording gage.

REMARKS.—Records fair except for periods of estimated record, which are poor. Low flow slightly affected by operation of reservoirs, 5.3 mi to 6.0 mi upstream from station, for municipal supply of Bucyrus. Water-quality and sediment data formerly collected at this site.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood of March 23, 1913 reached a stage of 14.5 ft, from floodmarks. Flood of January 22, 1959, reached a stage of 11.9 ft, from floodmarks; discharge, 13,500 ft³/s.

SURFACE-WATER RECORDS
Sandusky River Basin

04196800 TYMOCHTEE CREEK AT CRAWFORD, OHIO

LOCATION.—Latitude 40°55'22", longitude 83°20'56", in SE 1/4 sec. 27, T.1 S., R.13 E., Wyandot County, Hydrologic Unit 04100011, on right bank at downstream side of bridge on State Highway 199 (formerly U.S. Highway 23), 0.4 mi northwest of Crawford, Ohio, 1.5 mi downstream from Lick Run, 2.7 mi upstream from Little Tymochtee Creek, and 3 mi southeast of Carey, Ohio.

DRAINAGE AREA.—229 mi².

PERIOD OF RECORD.—Occasional low-flow measurements, water years 1961-63, and annual maximum, water years 1961-64, June 1964 to current year.

REVISED RECORDS.—WRD Ohio 1969: 1964(P), 1966(M), 1967(P).

GAGE.—Water-stage recorder. Datum of gage is 785.86 ft above sea level.

REMARKS.—Records fair except for periods of estimated record, which are poor. Beginning Mar. 9, 1972, water is diverted at a point 29.4 mi upstream from station into Killdeer Reservoir. Storage is available for low-flow augmentation. There were no low-flow augmentation releases during the year. During the year, withdrawals totaled 324 million gallons, equivalent to a mean annual withdrawal of 1.37 ft³/s. Return flow through Abraham Marsh totaled 142 million gallons, equivalent to a mean annual release of 0.60 ft³/s. Water-quality and sediment data formerly collected at this site.

a Peaks above base shown in table of peak discharges and stages at continuous-record surface-water-discharge stations.
e Estimated.

SURFACE-WATER RECORDS
Sandusky River Basin

04197170 ROCK CREEK AT TIFFIN, OHIO

LOCATION.—Latitude 41°06'49", longitude 83°10'06", Seneca County, Hydrologic Unit 04100011, on left bank 0.05 mi downstream from bridge on Rebecca Street, at Heidelberg College, Tiffin, Ohio.

DRAINAGE AREA.—34.6 mi².

PERIOD OF RECORD.—June 1983 to current year.

GAGE.—Water-stage recorder. Elevation of gage is 740 ft above sea level (from topographic map).

REMARKS.—Records fair except for periods of estimated record, which are poor.

SURFACE-WATER RECORDS
Sandusky River Basin

59

04198000 SANDUSKY RIVER NEAR FREMONT, OHIO

LOCATION.—Latitude 41°18'28", longitude 83°09'32", in sec. 17, T.4 N., R.15 E., Sandusky County, Hydrologic Unit 04100011, on left bank at downstream side of county road bridge, 2.3 mi upstream from Ballville diversion dam, 2.5 mi downstream from Wolf Creek, and 3.5 mi southwest of Fremont, Ohio.

DRAINAGE AREA.—1,251 mi².

WATER-DISCHARGE RECORDS

PERIOD OF RECORD.—November 1898 to March 1901 (gage height and discharge measurements only, published as "at Fremont"), October 1923 to December 1935, July 1938 to current year. Monthly discharge only for October 1923, published in WSP 1307.

REVISED RECORDS.—WSP 744: 1931-32. WSP 874: 1938. WSP 1144: 1924-30. WSP 1387: 1925, 1928-29, 1931-35. WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 626.3 ft above sea level. Nov. 18, 1898, to Mar. 10, 1901, nonrecording gage at site 4 mi downstream at different datum. Nov. 8, 1923, to Sep. 5, 1930, nonrecording gage at present site and datum.

REMARKS.—Records good except for periods of estimated record, which are poor. Water-quality data collected at this site.

WATER-QUALITY RECORDS

PERIOD OF RECORD.—Water years 1951-56, 1978 to current year.

PERIOD OF DAILY RECORD.—

CHLORIDE: February 1988 to September 1994.

NITROGEN, NITRITE + NITRATE: February 1988 to September 1994.

NITROGEN, AMMONIA + ORGANIC: February 1988 to September 1994.

PHOSPHORUS: February 1988 to September 1994.

SUSPENDED SEDIMENT DISCHARGE: Water years 1951-56, 1978 to current year.

INSTRUMENTATION.—Refrigerated water-quality pumping sampler, operated by Heidelberg College Water Quality Laboratory, from February 1988 to September 1994.

REMARKS.—Sediment samples were collected by a local observer on an approximate once daily basis. Sediment loads were calculated using the mean-interval method (Porterfield, George, 1972, Computation of Fluvial-Sediment Discharge: U.S. Geological Survey, Techniques of Water-Resources Investigations, Book 3, Chap. C3, 66 p.). For days with unsteady concentration, discharge, or both, the day was subdivided into half-hour intervals and the daily load was calculated by summing the loads for these half-hour intervals. This required interpolation between measured and estimated concentrations.

EXTREMES FOR PERIOD OF DAILY RECORD.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 2,420 mg/L, June 9, 1981; minimum daily mean, 1 mg/L, on many days during 1951-56, 1980, 1981, 1988, and 1992.

SEDIMENT LOADS: Maximum daily, 124,000 tons, June 14, 1981; minimum daily, less than 0.05 ton, on several days during 1952, 1954, and 1989.

EXTREMES FOR CURRENT YEAR.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 666 mg/L, June 19; minimum daily mean, 6 mg/L, Dec. 1 and 2.

SEDIMENT LOADS: Maximum daily, 18,500 tons, Apr. 9; minimum daily, 0.78 ton, Nov. 1.

SURFACE-WATER RECORDS
Huron River Basin

63

04199000 HURON RIVER AT MILAN, OHIO

LOCATION.—Latitude 41°18'06", longitude 82°36'25", in SW 1/4 sec. 4, T.5 N., R.22 W., Erie County, Hydrologic Unit 04100012, on right bank on upstream side of bridge on U.S. Highway 250, 0.2 mi northwest of Milan, Ohio, and 2.0 mi downstream from confluence of east and west branches.

DRAINAGE AREA.—371 mi².

PERIOD OF RECORD.—March 1950 to September 1980, October 1987 to current year.

REVISED RECORDS.—WSP 1912: Drainage area. WDR OH-89-2: 1988.

GAGE.—Water-stage recorder. Datum of gage is 573.26 ft above sea level. July 29, 1953, to Oct. 5, 1979, water-stage recorder at site of former highway bridge 500 ft downstream at same datum. July 29, 1953, nonrecording gage at site of former highway 450 ft downstream at same datum.

REMARKS.—Records fair except for periods of estimated record, which are poor. Water-quality and sediment data formerly collected at this site.

SURFACE-WATER RECORDS
Old Woman's Creek Basin

04199155 OLD WOMAN'S CREEK AT BERLIN ROAD NEAR HURON, OHIO

LOCATION.—Latitude 41°20'54", longitude 82°30'50", Erie County, Hydrologic Unit 04100012, on left downstream side of Berlin Road Bridge, 3.8 mi southeast of Huron, Ohio.

DRAINAGE AREA.—22.1 mi².

PERIOD OF RECORD.—October 1987 to September 1994, October 1995 to current year.

REVISED RECORDS.—WSP 1912: Drainage area. WDR OH-89-2: 1988.

GAGE.—Water-stage recorder. Datum of gage is 570 ft above sea level. Erie County benchmark.

REMARKS.—Records fair except for periods of estimated record, which are poor.

SURFACE-WATER RECORDS
Black River Basin

65

04200500 BLACK RIVER AT ELYRIA, OHIO

LOCATION.—Latitude 41°22'49", longitude 82°06'17", in T.6 N., R.17 W., Lorain County, Hydrologic Unit 04110001, on left bank in Cascade Park at Elyria, Ohio, 0.8 mi downstream from confluence of east and west branches.

DRAINAGE AREA.—396 mi².

PERIOD OF RECORD.—October 1944 to current year. Records for May 1903 to July 1906 (published as "near Elyria") published in WSP 97, 129, and 205, are unreliable and should not be used.

REVISED RECORDS.—WSP 1912: Drainage area. See also PERIOD OF RECORD.

GAGE.—Water-stage recorder. Datum of gage is 620.83 ft above sea level.

REMARKS.—Records fair except for periods of estimated record and for discharges greater than 1,000 ft³/s, which are poor. Some regulation at low flow for industrial use. Water-quality and sediment data formerly collected at this site.

SURFACE-WATER RECORDS
Rocky River Basin

04201500 ROCKY RIVER NEAR BEREAL, OHIO

LOCATION.—Latitude 41°24'24", longitude 81°53'14", in T.6 N., R.15 W., Cuyahoga County, Hydrologic Unit 04110001, on right bank at downstream side of Cedar Point Road Bridge in Rocky River Reservation, just downstream from confluence of east and west branches, and 3.0 mi northwest of Berea, Ohio.

DRAINAGE AREA.—267 mi².

PERIOD OF RECORD.—October 1923 to September 1935, September 1943 to current year. Monthly discharge only for October 1923, published in WSP 1307.

REVISED RECORDS.—WSP 1437: 1924, 1925(M), 1926, 1927(M), 1928-29, 1930-35(M), 1945. WSP 1912: Drainage area.

WDR-OH-2-1983: 1978-1982(M).

GAGE.—Water-stage recorder. Datum of gage is 649.90 ft above sea level (Cuyahoga County benchmark). Prior to Sept. 30, 1935, nonrecording gage at same site and datum.

REMARKS.—Records good except for periods of estimated record, which are poor. Some regulation at low flow by small reservoirs on East Branch. Some interbasin transfer of water from Lake Erie for municipal water supply by Cleveland Metro Water District. Water-quality and sediment data formerly collected at this site.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood in March 1913 reached a stage of 20.9 ft.

SURFACE-WATER RECORDS
Cuyahoga River Basin

67

04202000 CUYAHOGA RIVER AT HIRAM RAPIDS, OHIO

LOCATION.—Latitude 41°20'26", longitude 81°10'01", in T.5 N., R.7 W., Portage County, Hydrologic Unit 04110002, on left bank at downstream side of bridge on Winchell Road at Hiram Rapids, Ohio, 0.6 mi downstream from Black Brook.

DRAINAGE AREA.—151 mi².

PERIOD OF RECORD.—August 1927 to December 1935 (published as "near Hiram"), October 1944 to current year.

REVISED RECORDS.—WSP 1054: 1945. WSP 1437: 1931. WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 1,087.46 ft above sea level. Prior to Aug. 26, 1927, nonrecording gage and Aug. 26, 1927, to Dec. 31, 1935, water-stage recorder, at site 2.8 m downstream at different datum. Oct. 20, 1944, to Oct. 22, 1946, nonrecording gage at present site and datum.

REMARKS.—Records good except for periods estimated record, which are poor. Flow regulated by East Branch Reservoir, usable capacity, 4,140 acre-ft, 14.6 mi upstream since 1939, and by LaDue Reservoir, usable capacity, 18,110 acre-ft, 9.8 mi upstream since 1961. Water-quality data formerly collected at this site.

EXTREMES FOR PERIOD OF RECORD.—Maximum discharge, 3670 ft³/s Jan. 23, 1959, gage height 8.11 ft; minimum daily, 6.6 ft³/s Sept. 10, 1933.

SURFACE-WATER RECORDS
Cuyahoga River Basin

04203900 CUYAHOGA RIVER AT CUYAHOGA FALLS, OHIO

LOCATION.—Latitude 41°08'13", longitude 81°28'54", Summit County, Hydrologic Unit 04110002, on right bank, concrete retaining wall adjacent to restaurant parking lot 40 ft east of River Parkway, 50 ft upstream from abandoned hydroelectric dam in Cuyahoga Falls, Ohio.

DRAINAGE AREA.—333 mi².

PERIOD OF RECORD.—July 26, 1999, to current year.

GAGE.—Reference point, twice daily observations by the City of Cuyahoga Falls during work-week to Nov. 15. Altitude of gage is 995 ft, from topographic map.

REMARKS.—Records poor.

SURFACE-WATER RECORDS
Cuyahoga River Basin

69

04206000 CUYAHOGA RIVER AT OLD PORTAGE, OHIO

LOCATION.—Latitude 41°08'08", longitude 81°32'50", Summit County, Hydrologic Unit 04110002, on right bank 230 ft upstream from North Portage Path bridge at Old Portage, Ohio, 1.2 mi downstream from Little Cuyahoga River, and 4 mi northwest of Akron City Hall, Akron, Ohio.

DRAINAGE AREA.—404 mi².

PERIOD OF RECORD.—September 1921 to December 1935, March 1939 to current year.

REVISED RECORDS.—WSP 1307: 1924(M), WSP 1912: Drainage area. WDR OH-79-2: 1974(M), 1976(M).

GAGE.—Water-stage recorder. Datum of gage is 740.11 ft above sea level, unadjusted. Prior to Dec. 21, 1923, nonrecording gage at same site and datum.

REMARKS.—Records good except for periods of estimated record, which are fair. Natural flow of stream affected by diversions, storage reservoirs, and power plants. At Lake Rockwell, 17.1 mi upstream from gage, an average of 63 ft³/s was diverted for municipal supply of city of Akron. Sewage from city enters river 2.9 mi downstream from station. Some diversions from the Tuscarawas River Basin drainage into this basin at Portage Lakes (see REMARKS from station 0311700 in volume 1 of this report). Sediment data formerly collected at this site. Water-quality data collected and published in project data, Microbial Water-Quality in Relation to Water-Contact Recreation, Cuyahoga Valley National Park, Ohio. Satellite telemeter at gage.

SURFACE-WATER RECORDS
Cuyahoga River Basin

04206212 NORTH FORK AT BATH CENTER, OHIO

LOCATION.—Latitude 41°10'08", longitude 81°38'04", Summit County, Hydrologic Unit 04110002, on left upstream side of bridge on Bath Road, 750 ft east of Cleveland-Massillon Road at Bath Center, Ohio, 3.1 mi northwest of Akron corporate boundary.

DRAINAGE AREA.—5.58 mi².

PERIOD OF RECORD.—October 1, 1991, to current year.

GAGE.—Water-stage recorder. Datum of gage is 932.57 ft above sea level (North American Vertical Datum of 1988).

REMARKS.—Records fair except for periods of estimated record and discharges of less than 5 ft³/s, which are poor.

SURFACE-WATER RECORDS
Cuyahoga River Basin

71

04206220 YELLOW CREEK AT BOTZUM, OHIO

LOCATION.—Latitude 41°09'47", longitude 81°35'02", Summit County, Hydrologic Unit 04110002, on right downstream bank near Bath Road truss bridge over Yellow Creek, 0.5 mi upstream from confluence with Cuyahoga River, 0.7 mi west of Akron sewage treatment plant.

DRAINAGE AREA.—30.7 mi².

PERIOD OF RECORD.—October 1, 1991, to current year.

GAGE.—Water-stage recorder. Datum of gage is 739.09 ft above sea level (North American Vertical Datum of 1988).

REMARKS.—Records fair except for periods of estimated record, which are poor. (Formerly named Yellow Creek at Bath Road near Botzum, Ohio).

SURFACE-WATER RECORDS
Cuyahoga River Basin

73

04208000 CUYAHOGA RIVER AT INDEPENDENCE, OHIO

LOCATION.—Latitude 41°23'43", longitude 81°37'48", in T.6 N., R.12 W., Cuyahoga County, Hydrologic Unit 04110002, on left bank 240 ft downstream from bridge on Old Rockside Road, 0.8 mi northeast of Independence, Ohio, and 3.0 mi downstream from Tinkers Creek.
DRAINAGE AREA.—707 mi².

WATER-DISCHARGE RECORDS

PERIOD OF RECORD.—September 1903 to December 1905 (fragmentary), January to July 1906 (gage heights and discharge measurements only), September 1921 to May 1923, September 1927 to December 1935, March 1940 to current year.

REVISED RECORDS.—WSP 1307: 1922-23(M), 1928-30(M), 1933(M), 1940(M), 1947(M), 1950(M). WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 583.57 ft above sea level. Sept. 21, 1903 to July 21, 1906, nonrecording gage at bridge 240 ft upstream at present datum. Sept. 28, 1921 to May 30, 1923, nonrecording gage at bridge 240 ft upstream at datum 2.42 ft higher. Sept. to Oct. 8, 1927, nonrecording gage, and Oct. 9, 1927; to Dec. 31, 1935; and Mar. 5, 1940, to June 19, 1969, water-stage recorder at site 100 ft upstream at present datum.

REMARKS.—Records good except for period of estimated record, which are poor. Natural flow of stream affected by diversion, storage reservoirs, and powerplants. Some diversion from the Tuscarawas River Basin drainage into this basin at Portage Lakes (see REMARKS for station 03117000). Water diverted into Ohio Canal at Brecksville, 6 mi upstream from station, bypasses station. These records do not include flow in canal except above about 15,000 ft³/s, when channels merge. Satellite telemeter at gage. Water-quality data collected at this site. Additional water-quality data is in project data, Microbial Water-Quality in Relation to Water-Contact Recreation, Cuyahoga Valley National Park, Ohio.

WATER-QUALITY RECORDS

PERIOD OF RECORD.—October 1948 to September 1949, October 1950 to current year.

PERIOD OF DAILY RECORD.—

CHLORIDE: October 1987 to September 1994.

NITROGEN, NITRITE + NITRATE: October 1987 to September 1994.

NITROGEN, AMMONIA + ORGANIC: October 1987 to September 1994.

PHOSPHORUS: October 1987 to September 1994.

SUSPENDED SEDIMENT DISCHARGE: Water years 1950-74, December 1976 to September 1984, October 1987 to current year.

INSTRUMENTATION.—Alcohol-actuated thermograph October 1956 to June 1965, water-quality monitor from July 1965 to September 1991, and a refrigerated water-quality pumping sampler, operated by Heidelberg College Water Quality Laboratory, from October 1987 to September 1994.

REMARKS.—Sediment samples were collected by a local observer on an approximate once daily basis. Sediment loads were calculated using the mean-interval method (Porterfield, George, 1972, Computation of Fluvial-Sediment Discharge: U.S. Geological Survey, Techniques of Water-Resources Investigations, Book 3, Chap. C3, 66 p.). For days with unsteady concentration, discharge, or both, the day was subdivided into half-hour intervals and the daily load was calculated by summing the loads for these half-hour intervals. This required interpolation between measured and estimated concentrations.

EXTREMES FOR PERIOD OF DAILY RECORD.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 3,400 mg/L, Dec. 31, 1992; minimum daily mean, 1 mg/L, Feb. 12 and 13, 1989.

SEDIMENT LOADS: Maximum daily, 82,900 tons, Dec. 31, 1992; minimum daily, 1.2 tons, Feb. 13, 1989.

EXTREMES FOR CURRENT YEAR.—

SEDIMENT CONCENTRATIONS: Maximum daily mean, 1,030 mg/L, Nov. 3; minimum daily mean, 5 mg/L, Oct. 8, Dec. 1, 2, Feb. 7, and 8.

SEDIMENT LOADS: Maximum daily, 18,000 tons, Apr. 8; minimum daily, 3.0 tons, Oct. 8.

SURFACE-WATER RECORDS
Cuyahoga River Basin

77

04208504 CUYAHOGA RIVER AT LTV STEEL AT CLEVELAND, OHIO

LOCATION.—Latitude 41°27'45", longitude 81°40'52", Cuyahoga County, Hydrologic Unit 04110002, on left bank, at LTV Steel Company footbridge, 1.2 mi downstream from Big Creek, 5.5 mi upstream from mouth at Cleveland, Ohio.

DRAINAGE AREA.—788 mi².

PERIOD OF RECORD.—October 1, 1991 to current year.

GAGE.—Water-stage and acoustic velocity meter recorder. Elevation of gage is 583.57 ft above sea level (from topographic map).

REMARKS.—Records poor.

EXTREMES FOR PERIOD OF RECORD.—Maximum discharge, 15,500 ft³/s Aug. 13, 1994; minimum daily discharge, 310 ft³/s Aug. 29, 1993.

EXTREMES FOR CURRENT YEAR.—Maximum daily discharge, 11,000 ft³/s Apr. 9; minimum daily discharge, 500 ft³/s Oct. 8.

SURFACE-WATER RECORDS
Grand River Basin

04212100 GRAND RIVER NEAR PAINESVILLE, OHIO

LOCATION.—Latitude 41°43'08", longitude 81°13'41", Lake County, Hydrologic Unit 04110004, on downstream left abutment of bridge on State Highway 84 (Walnut Avenue), 0.9 mi downstream from Big Creek in Painesville, Ohio.

DRAINAGE AREA.—685 mi².

PERIOD OF RECORD.—October 1974 to current year.

GAGE.—Water-stage recorder. Datum of gage is 596.37 ft above sea level. Previously published in error as 620.37 ft above sea level.

REMARKS.—Records good except for periods of estimated record, which are poor. Water-quality data formerly collected at this site.

SURFACE-WATER RECORDS
Conneaut Creek Basin

79

04213000 CONNEAUT CREEK AT CONNEAUT, OHIO

LOCATION.—Latitude 41°55'37", longitude 80°36'15", Ashtabula County, Hydrologic Unit 04120101, on right bank at downstream side of Keefus Road bridge at Conneaut, Ohio, and 6.4 mi upstream from mouth.

DRAINAGE AREA.—175 mi².

PERIOD OF RECORD.—July 1922 to December 1935, March 1950 to September 1961 (published as "at Amboy"), October 1961 to current year.

REVISED RECORDS.—WSP 714: 1926. WSP 784: 1933. WSP 1437: 1923-25(M), 1926-30, 1931-32(M), 1933, 1935(M). WSP 1912: Drainage area.

GAGE.—Water-stage recorder. Datum of gage is 610.30 ft above sea level. Prior to Aug. 17, 1924, nonrecording gage at same site and datum.

REMARKS.—Records good except for periods of estimated record, which are poor. Water-quality and sediment data formerly collected at this site.

**PEAK DISCHARGE AND STAGE
AT CONTINUOUS-RECORD SURFACE DISCHARGE STATIONS**

For continuous-record surface-water-discharge stations meeting certain criteria, all peak discharges and stages occurring during the water year and greater than a selected base discharge are presented in this table. The peaks greater than the base discharge, excluding the highest one, are referred to as secondary peaks. The peaks are listed in chronological order. Peak discharges are not published for canals, ditches, drains, or streams for which the peaks are subject to substantial control by human intervention. The time of occurrence for peaks is expressed in 24-hour local standard time. For example, 12:30 a.m. is 0030 and 1:30 p.m. is 1330. The maximum peak discharge and gage height for the water year are flagged with an asterisk (*).

GROUND-WATER RECORDS
Crawford County

404838082563100. LOCAL NUMBER, CR-1

LOCATION.—Latitude 40°48'38", longitude 82°56'31", Hydrologic Unit 04100011, Timken Roller Bearing Company, U.S. 30 in Bucyrus. Owner: Timken Roller Bearing Company.

AQUIFER.—Sand and gravel of Pleistocene Age.

WELL CHARACTERISTICS.—Drilled test water-table well, diameter 6 in., depth 54 ft, cased.

INSTRUMENTATION.—Digital recorder, 60-minute punch.

DATUM.—Elevation of land-surface datum is 1039.13 ft above sea level. Measuring point: Floor of instrument shelter 3.50 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

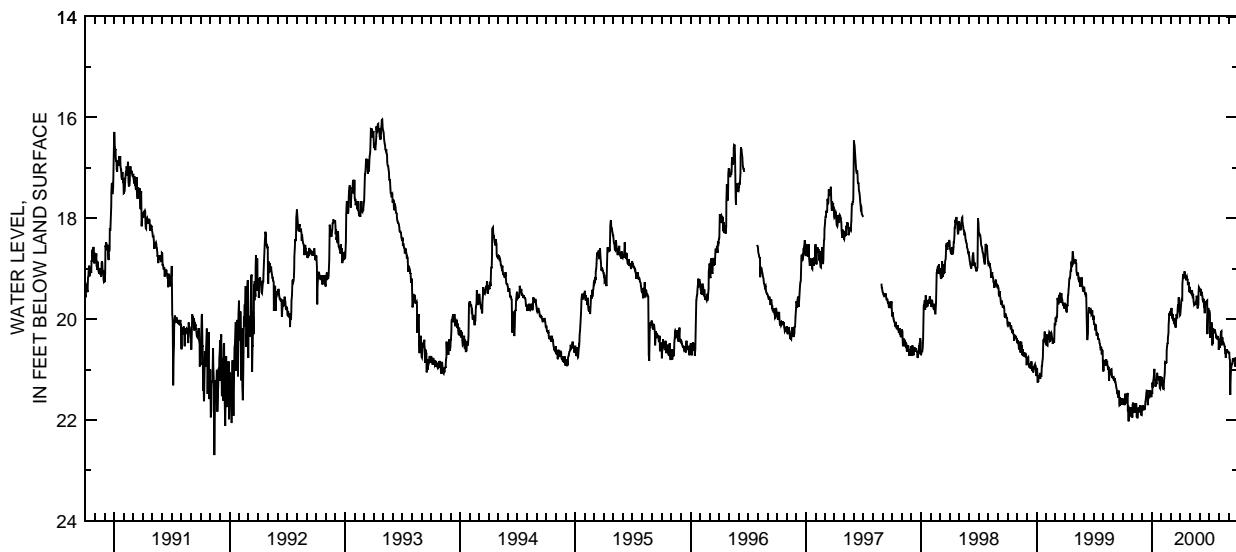

PERIOD OF RECORD.—April 1962 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 37.64 ft below land-surface datum, Dec. 11, 1962; minimum daily low, 16.04 ft below land-surface datum, Apr. 29, 1993.

GROUND-WATER RECORDS
Geauga County

83

412518081221500. LOCAL NUMBER, GE-3A

LOCATION.—Latitude 41°25'18", longitude 81°22'15", Hydrologic Unit 04110003, 1.2 miles southeast of Chagrin Falls, Ohio. Owner: City of Chagrin Falls.

AQUIFER.—Sandstone of Pennsylvanian Age.

WELL CHARACTERISTICS.—Drilled unused artesian well, diameter 6 in., depth drilled 120 ft, present depth 89 ft, cased.

INSTRUMENTATION.—Digital recorder, 60-minute punch.

DATUM.—Elevation of land-surface datum is 1130 ft above sea level. Measuring point: Floor of instrument shelter 3.50 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 3.0 ft above land-surface datum.

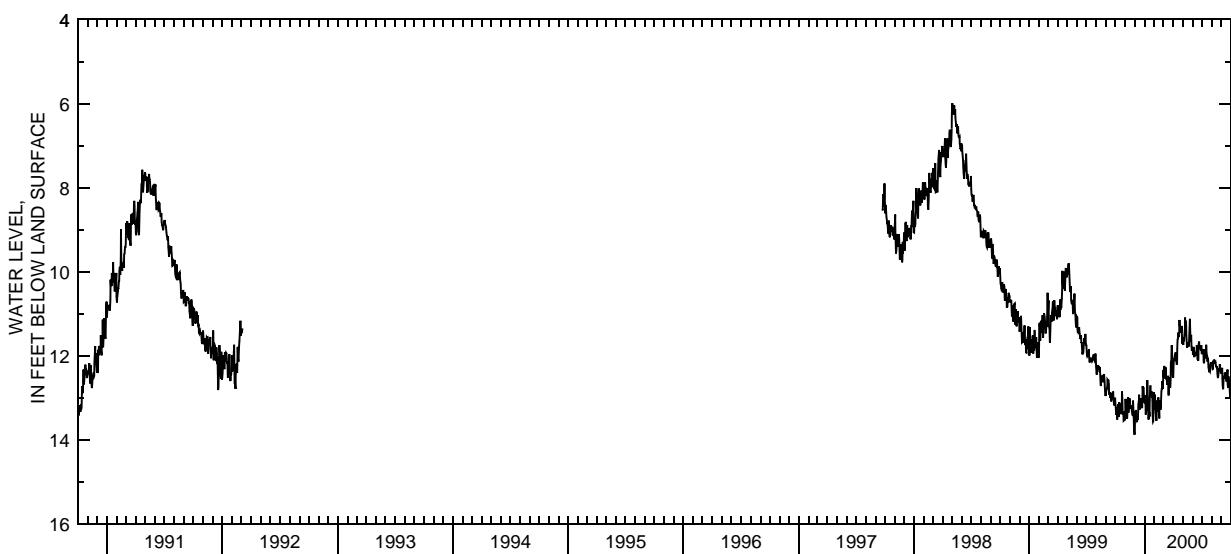

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water. Water level affected by pumping wells nearby for Chagrin Falls municipal supply.

PERIOD OF RECORD.—September 1951 to September 1991 continuous. Discontinued October 1991 to March 1996. Periodic measurements April 1996 to September 1997. Continuous September 1997 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 52.85 ft below land-surface datum, Oct. 2, 1965; minimum daily low, 5.99 ft below land-surface datum, May 2, 1998.

404648083412600. LOCAL NUMBER, HN-2A

LOCATION.—Latitude 40°46'48", longitude 83°41'26", Hydrologic Unit 04100007, at southeast edge of Dola, Ohio. Owner: Kevin Eikenbary.

AQUIFER.—Limestone of Silurian Age.

WELL CHARACTERISTICS.—Drilled unused artesian well, diameter 6 in., depth 51 ft, cased.

INSTRUMENTATION.—Electronic data logger, 60-minute log interval. Satellite telemeter at site.

DATUM.—Elevation of land-surface datum is 945 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 2.88 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

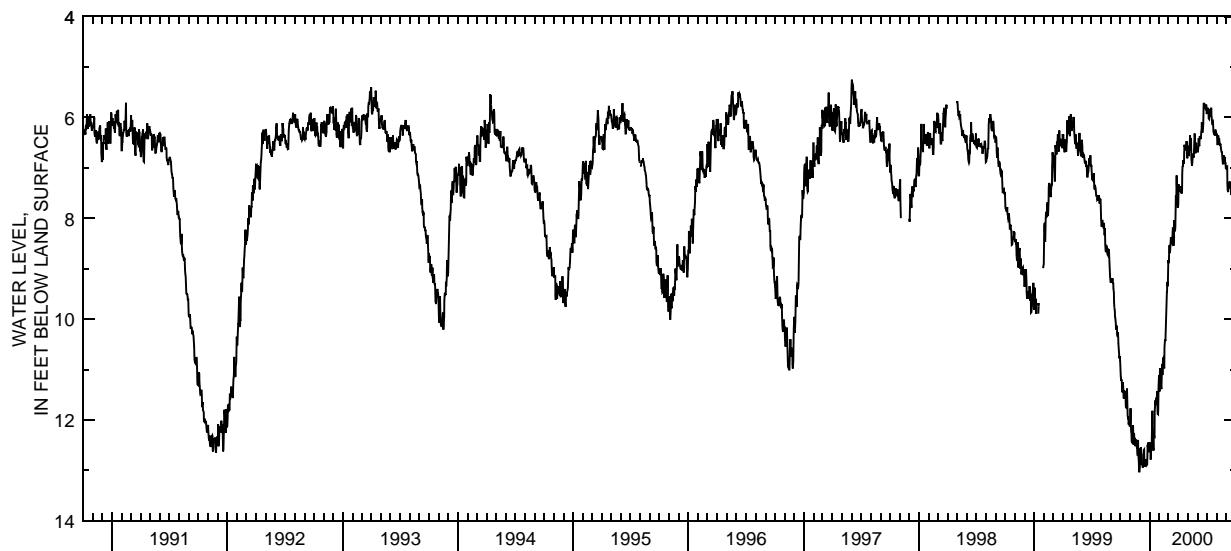

PERIOD OF RECORD.—December 1954 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 15.86 ft below land-surface datum, Jan. 20, 21, 1965; minimum daily low, 5.25 ft below land-surface datum, June 2, 1997.

LOCATION.—Latitude 41°37'04", longitude 83°36'22", Hydrologic Unit 04100001, at Toledo State Hospital, Toledo, Ohio. Owner: State of Ohio.

AQUIFER.—Limestone of Silurian Age.

WELL CHARACTERISTICS.—Drilled unused artesian well, diameter 12 in., depth drilled 525 ft, present depth 523.0 ft, cased to 93 ft.

INSTRUMENTATION.—Type F continuous recorder.

DATUM.—Elevation of land-surface datum is 624 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 2.98 ft above land-surface datum (Revised from 1978 and 1979).

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water. Prior to Aug. 23, 1978, measuring point was 3.10 ft above land-surface datum. Reported in 1979 as 3.00 ft above land-surface datum.

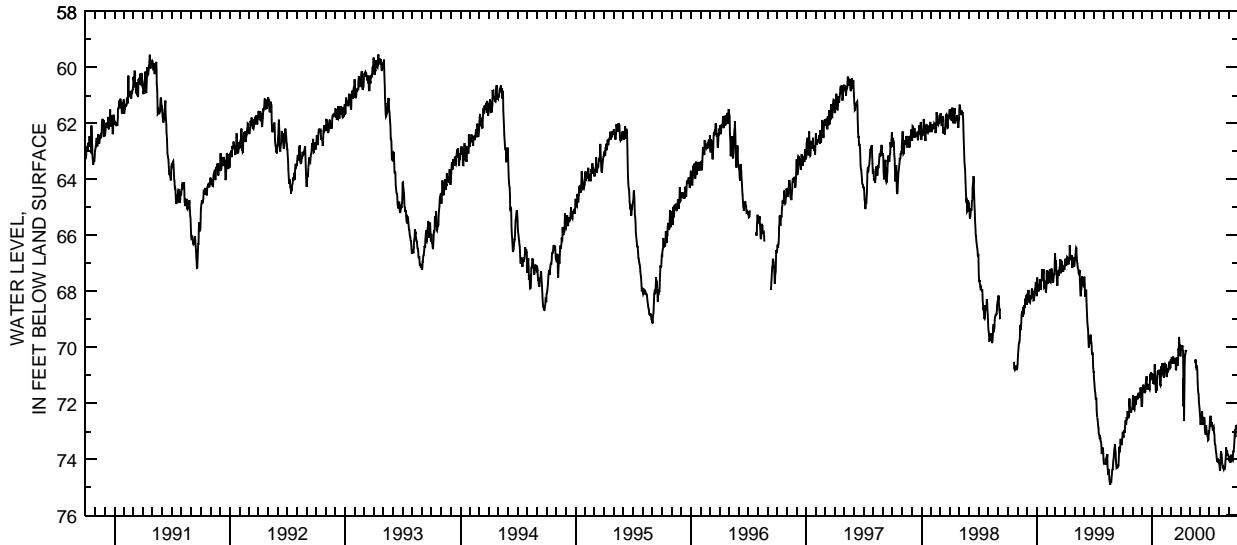

PERIOD OF RECORD.—March 1946 to September 1982 continuous, October 1983 to January 1985 periodic, continuous thereafter.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 117.25 ft below land-surface datum, Sept. 18, 1957; minimum daily low, 56.87 ft below land-surface datum, Apr. 16, 1987.

Medina County

410142082005900. LOCAL NUMBER, MD-1

LOCATION.—Latitude 41°01'42", longitude 82°00'59", Hydrologic Unit 04110001, at waterworks plant at Lodi, Ohio. Owner: Lodi Water Department.

AQUIFER.—Sand and gravel of Pleistocene Age.

WELL CHARACTERISTICS.—Drilled unused water-table well, diameter 6 in., depth 65 ft, cased.

INSTRUMENTATION.—Digital recorder, 60-minute punch.

DATUM.—Elevation of land-surface datum is 910 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 1.90 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

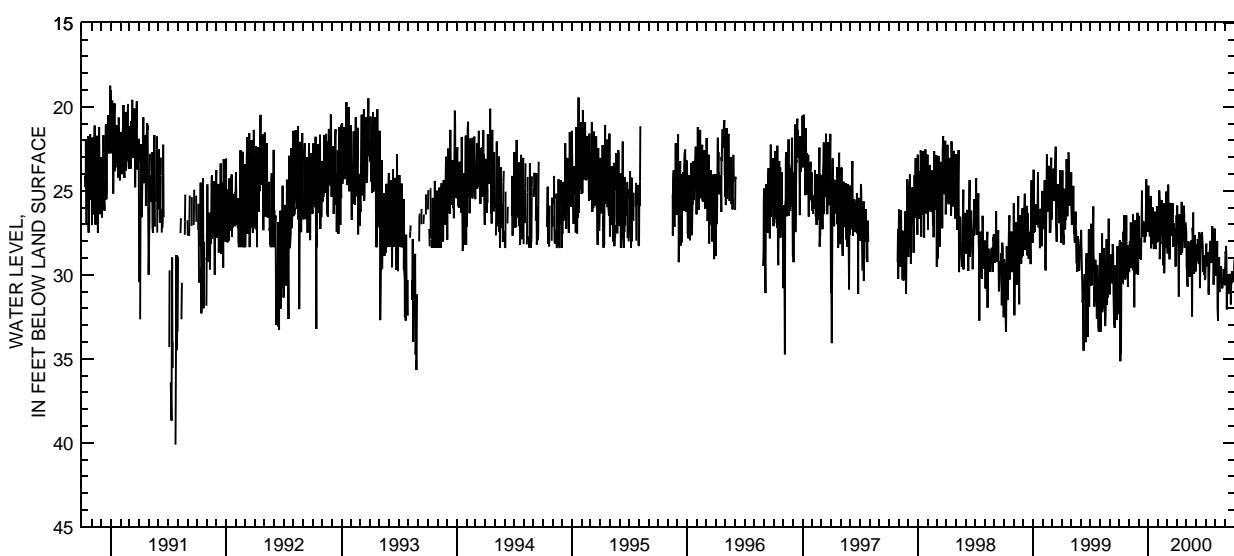

PERIOD OF RECORD.—September 1946 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 45.21 ft below land-surface datum, July 8, 1988; minimum daily low, 7.60 ft below land-surface datum, July 6, 1969.

GROUND-WATER RECORDS
Portage County

410931081192900. LOCAL NUMBER, PO-123

LOCATION.—Latitude 41°09'31", longitude 81°19'29", Hydrologic Unit 04110002, east of Kent, Ohio. Owner: City of Kent.

AQUIFER.—Sand and gravel of Pleistocene Age.

WELL CHARACTERISTICS.—Drilled unused artesian well, diameter 6 in., cased.

INSTRUMENTATION.—Digital recorder, 60-minute punch.

DATUM.—Elevation of land-surface datum is 1042 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 3.5 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

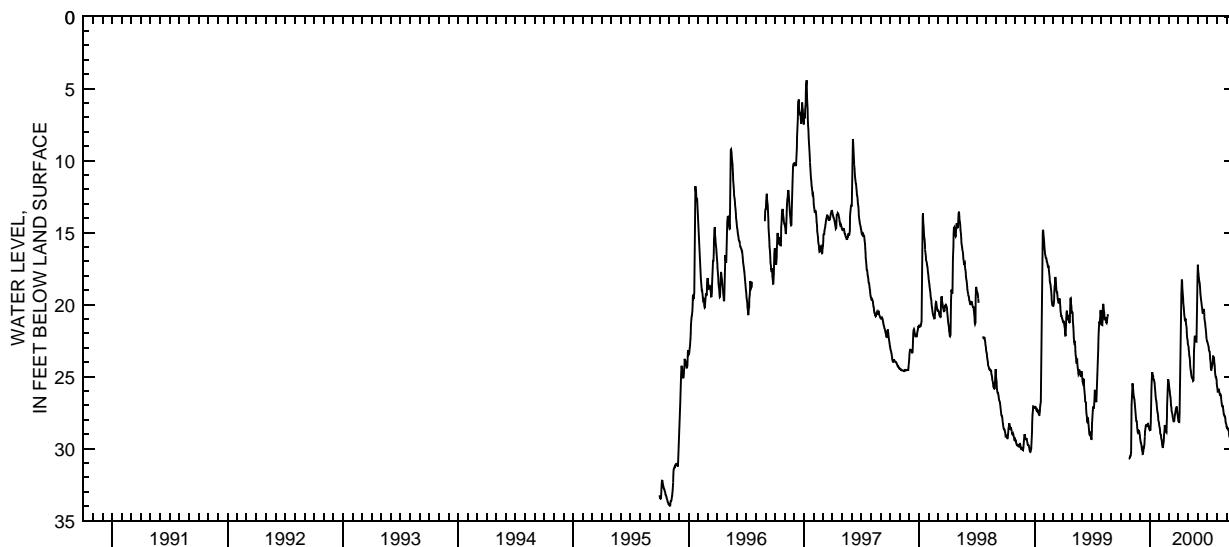

PERIOD OF RECORD.—October 1995 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 33.97 ft below land-surface datum, Nov. 3, 1995; minimum daily low, 4.43 ft below land-surface datum, Jan. 9, 1997.

412703083213600. LOCAL NUMBER, S-2

LOCATION.—Latitude 41°27'03", longitude 83°21'36", Hydrologic Unit 04100010, at waterworks in Woodville, Ohio. Owner: Woodville Water Department.

AQUIFER.—Limestone of Silurian Age.

WELL CHARACTERISTICS.—Drilled unused artesian well, diameter 8 in., depth 198 ft cased.

INSTRUMENTATION.—Digital recorder, 60-minute punch.

DATUM.—Elevation of land-surface datum is 635 ft above sea level from topographic map. Measuring point: Top of casing at land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

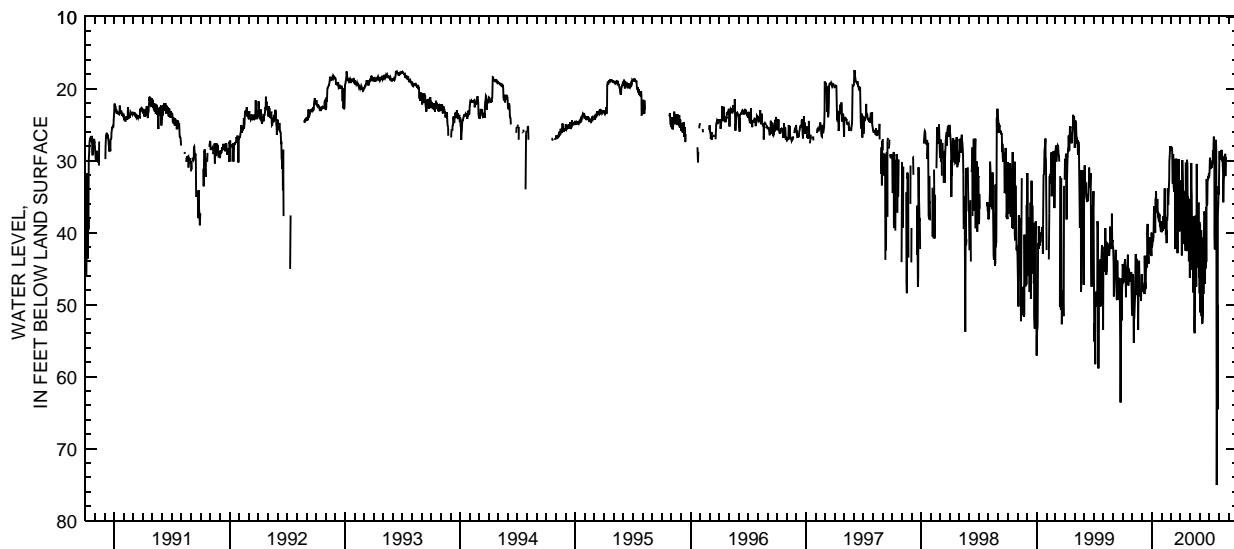

PERIOD OF RECORD.—June 1976 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 100.97 ft below land-surface datum, Jan. 29, 1982; minimum daily low, 17.43 ft below land-surface datum, June 3, 1997.

WTR YR 2000 LOW 14.50

GROUND-WATER RECORDS
Summit County

410846081271600. LOCAL NUMBER, SU-7

LOCATION.—Latitude 41°08'46", longitude 81°27'16", Hydrologic Unit 04110002, Monroe Falls Road, Cuyahoga Falls, Ohio. Owner: Cuyahoga Falls Water Department.

AQUIFER.—Sand and gravel of Pleistocene Age.

WELL CHARACTERISTICS.—Drilled unused water-table, diameter 6 in., depth 100 ft, cased.

INSTRUMENTATION.—Digital recorder, 60-minute punch.

DATUM.—Elevation of land-surface datum is 994 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 5.00 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

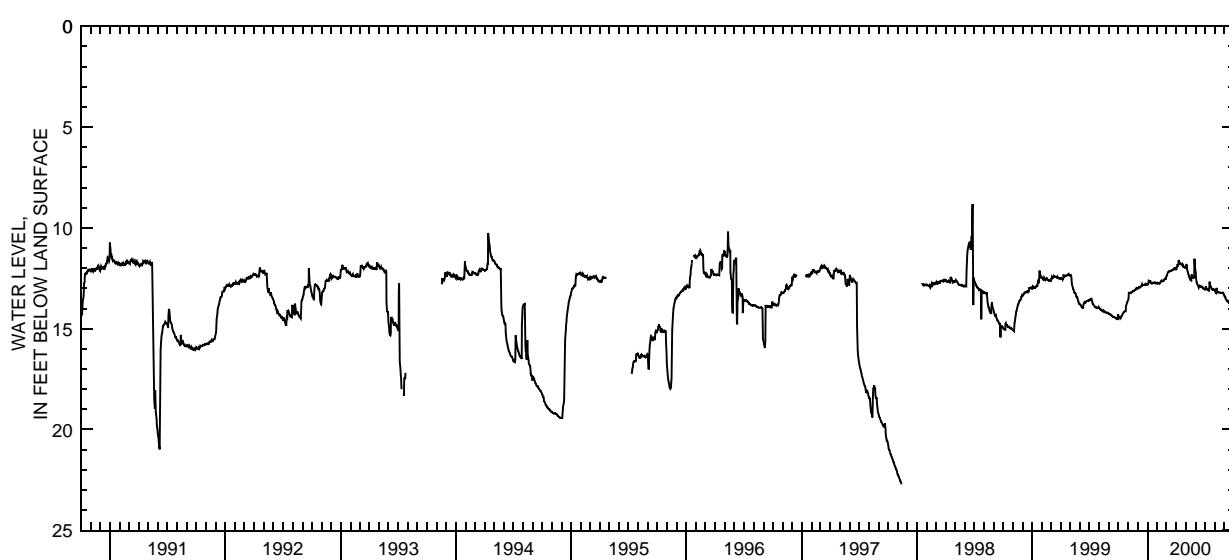

PERIOD OF RECORD.—August 1968 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 46.90 ft below land-surface datum, Jan. 22, 1999; minimum daily low, 0.67 ft above land-surface datum, Apr. 15, 1994.

GROUND-WATER RECORDS
Van Wert County

97

405215084335400. LOCAL NUMBER, VW-1

LOCATION.—Latitude 40°52'15", longitude 84°33'54", Hydrologic Unit 04100007, Ridge Road near Van Wert, Ohio. Owner: Marsh Foundation.

AQUIFER.—Limestone of Silurian Age.

WELL CHARACTERISTICS.—Drilled unused artesian well, diameter 8 in., depth 340 ft, cased.

INSTRUMENTATION.—Type F continuous recorder.

DATUM.—Elevation of land-surface datum is 790.37 ft above sea level. Measuring point: Floor of instrument shelter 6.15 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water. Water-quality data collected at this site and published in project data, Ground-Water Data for Ohio Department of Natural Resources.

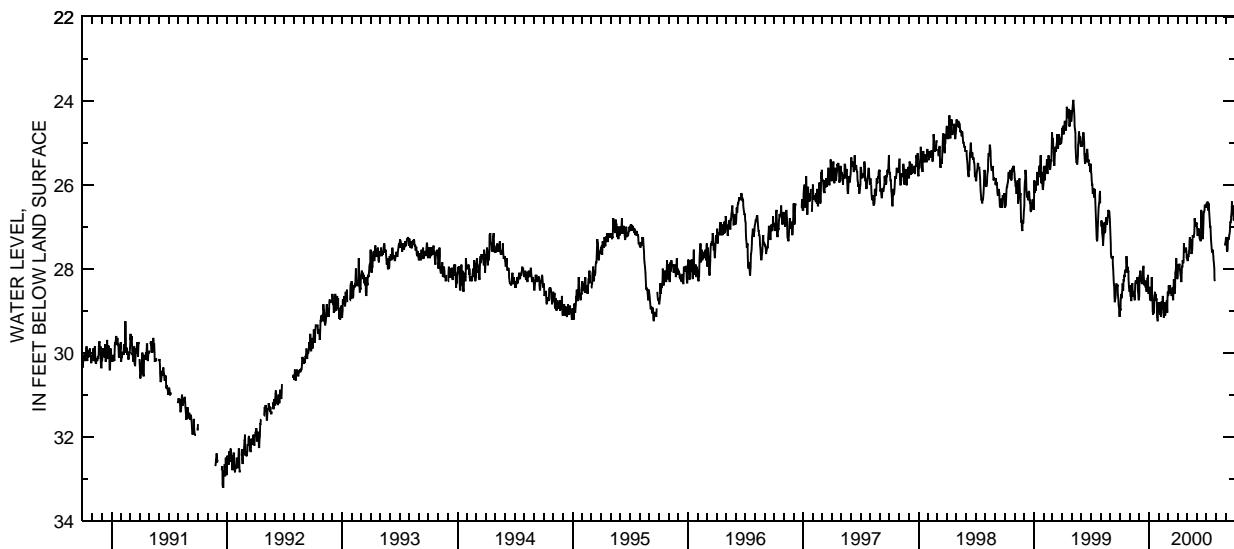

PERIOD OF RECORD.—August 1957 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low 33.20 ft below land-surface datum, Dec. 20-21, 1991; minimum daily low, 18.85 ft below land-surface datum, Mar. 6, 1959.

Williams County**413108084415300. LOCAL NUMBER, WM-12**

LOCATION.—Latitude 41°31'08", longitude 84°41'53", Hydrologic Unit 04100003, 1.7 mi east of Blakeslee, Ohio. Owner: State of Ohio.
AQUIFER.—Sand and gravel of Pleistocene Age.

WELL CHARACTERISTICS.—Drilled test artesian well, diameter 10 in., depth 115 ft, cased to 85 ft, screened 85 ft to 115 ft.

INSTRUMENTATION.—Periodic measurement with chalked tape by ODNR personnel.

DATUM.—Elevation of land-surface datum is 830 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 1.50 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

PERIOD OF RECORD.—1974 to September 1982 continuous, periodic October 1983 to December 1984, continuous January 1985 to November 1986, periodic thereafter.

EXTREMES FOR PERIOD OF RECORD.—Maximum measured low, 10.75 ft below land-surface datum, Nov. 29, 1999; minimum daily low, 3.83 ft below land-surface datum, Mar. 17, 1982.

Wyandot County

101

405009083172600. LOCAL NUMBER, WY-1

LOCATION.—Latitude 40°50'09", longitude 83°17'26", Hydrologic Unit 04100011, State Route 199, Upper Sandusky, Ohio. Owner: Karg Supply Company.

AQUIFER.—Limestone of Silurian Age.

WELL CHARACTERISTICS.—Drilled unused artesian well, diameter 5 in, depth 90 ft, cased.

INSTRUMENTATION.—Digital recorder, 60-minute punch.

DATUM.—Elevation of land-surface datum is 850 ft above sea level, from topographic map. Measuring point: Floor of instrument shelter 3.00 ft above land-surface datum.

REMARKS.—Station operated by Ohio Department of Natural Resources, Division of Water.

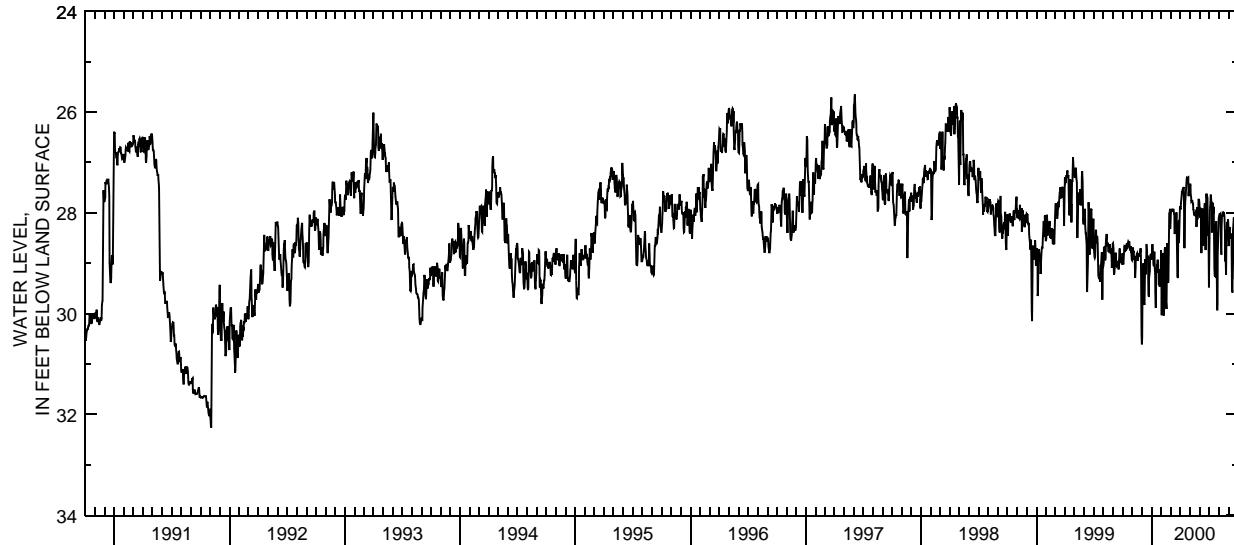

PERIOD OF RECORD.—September 1951 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 40.90 ft below land-surface datum, July 12, 15, 17, 21, Aug. 26, 1961; minimum daily low, 25.65 ft below land-surface datum, June 5, 1997.

PROJECT DATA

City of Akron Water Diversion

The Ohio and Erie Canal runs from the Little Cuyahoga River through the City of Akron, through Summit Lake, past Lake Nesmith to Wolf Creek, a tributary to the Tuscarawas River. Water is diverted from Long Lake, one of the Portage Lakes, into the canal system at the Long Lake Feeder Water Control structure near Lake Nesmith. The water can either flow north into the Little Cuyahoga River or south to the Tuscarawas River. The following three discharge gaging stations are on the Ohio and Erie Canal system in the Akron area. The Long Lake Feeder gage measures water flow into the canal, while the Ohio and Erie Canal at Lock 1 gage and the Wolf Creek Outlet gage measure water flow to the north and south, respectively. The tables contain the daily mean discharges at each gaging station.

PROJECT DATA
City of Akron Water Diversion

103

410121081330300 LONG LAKE FEEDER TO OHIO & ERIE CANAL AT AKRON, OHIO

LOCATION.—Latitude 41°01'21", longitude 81°33'03", Summit County, Hydrologic Unit 05040001, in canal feeder gate house control structure at north end of Long Lake Channel on west side of State Route 93 (Manchester Road), 0.1 mi south of Lake Nesmith, at Akron, Ohio.

DRAINAGE AREA.—Not determined.

PERIOD OF RECORD.—June 12, 1998 to current year.

GAGE.—Acoustic Doppler flow meter records water depth, discharge, and velocity.

REMARKS.—Records are good, except for periods of estimated daily discharges, which are fair, and December 17 to January 9, August 27 to September 20, September 23 to September 30, and daily discharges greater than 28 ft³/s, which are poor. Flow is completely regulated by operation of gates at flow-control structure upstream of gage.

PROJECT DATA
City of Akron Water Diversion

410433081312500 OHIO & ERIE CANAL AT LOCK 1 AT AKRON, OHIO

LOCATION.—Latitude 41°04'33", longitude 81°31'25", Summit County, Hydrologic Unit 05040001, at lower pool level of Lock 1, at south end of culvert under West Exchange Street, 1.6 mi. northeast of Summit Lake, at Akron, Ohio.

DRAINAGE AREA.—Not determined.

PERIOD OF RECORD.—June 1, 1998 to current year.

GAGE.—Water-stage recorder. Datum of gage is 953.76 ft above sea level.

REMARKS.—Record is good, except for estimated daily discharges, flows greater than 175 ft³/s, and a period of significant in-channel weed growth (June 1 to September 30), which are poor. Flow is completely regulated by operation of gate at Lock 1.

REVISIONS.—WDR OH-99-2: 1998, 1998(M).

PROJECT DATA
City of Akron Water Diversion

105

410014081362600 WOLF CREEK OUTLET OF OHIO & ERIE CANAL AT BARBERTON, OHIO

LOCATION.—Latitude 41°00'14", longitude 81°36'26", Summit County, Hydrologic Unit 05040001, at Wolf Road culvert for the Ohio and Erie Canal outlet, 0.1 mi. above confluence with Wolf Creek, 0.2 mi. from confluence of Wolf Creek and Tuscarawas River, 0.6 mi. east of Columbia Lake, at Barberton, Ohio.

DRAINAGE AREA.—Not determined.

PERIOD OF RECORD.—June 1, 1998 to current year.

GAGE.—Water-stage recorder. Datum of gage is 952.00 ft above sea level.

REMARKS.—Record is fair, except for October 1 to December 27 and July 13 to September 30, which are poor. Flow is completely regulated by operation of gate at outlet structure.

PROJECT DATA

The following tables list the results of chemical analysis of surface-water samples collected from Truetown mine drain (392652082062200), Sunday Creek above mine drain (392705082061400), and Sunday Creek below mine drain (392637082062100). Samples were collected monthly beginning in May 1999 to characterize water quality at these sites before reclamation projects to reduce acid-mine drainage are conducted.

PROJECT DATA
Monitoring of Truetown Mine Outflow

107

392652082062200 MINE DRAIN AT TRUETOWN, OHIO

LOCATION.—Latitude 39°26'52", longitude 82°06'22", Athens County, Hydrologic Unit 05030204, left bank of impoundment pool mine drain outlet at Truetown, Ohio.

DRAINAGE AREA.—Not determined.

PERIOD OF RECORD.—June 1, 1999, to current year.

GAGE.—Water -tage recorder.

REMARKS.—Records fair except for period of estimated discharge, which are poor.

EXTREMES FOR PERIOD OF RECORD—Maximum instantaneous discharge, 3.4 ft³/s June 2 and 3, 1999; minimum instantaneous discharge, 1.1 ft³/s Oct. 24, 25, 27-31, 1999.

EXTREMES FOR CURRENT YEAR.—Maximum discharge, 2.7 ft³/s, many days, gage height 4.31 ft, many days; minimum discharge, 1.1 ft³/s, Oct. 27, 1999.

Determination of Flow and Selected Water-Quality Characteristics of the Ottawa River

The following tables contain measurements of streamflow, dissolved oxygen concentrations, and concentrations of various chemical constituents for streamwater sites along the Ottawa River and its tributaries in Hardin, Allen, and Putnam Counties. The data were collected in cooperation with the Ottawa River Coalition during the following times: September 1999, September 2000, and July 2000. Objectives of the study are to plot the correlation of the base streamflow at each site and an index station (Auglaize River at Ft. Jennings, Ohio) and to determine the concentration of selected water-quality constituents during periods of potential stress on the aquatic communities at 19 sites.

Geochemistry and Ground-Water Flow Beneath an Abandoned Coal Mine Reclaimed with FGD By-Products

The site selected for study is in Tuscarawas County, Ohio, and is also known as the Fleming abandoned mine site. FGD by-products are produced as a result of injection of dolostone slurry through the flue gases of coal-burning utilities that use high-sulfur coals as fuel. Beneficial uses of the by-products are being developed, and their environmental effects are being assessed.

The following tables list ground-water levels and chemical analyses of interstitial-, ground-, and surface-water samples collected from an abandoned mine site that has been reclaimed in part by application of a coal-combustion by-product, also known as flue-gas desulfurization (FGD) by-product. Water levels in wells were measured periodically. Interstitial waters were sampled by use of soil-suction lysimeters. The lysimeters produced only small amounts of water; thus, chemical analyses for interstitial water are incomplete.

WELL, SOIL-SUCTION LYSIMETER, AND SURFACE-WATER SITE DESCRIPTIONS

(The following site description applies to all soil-suction lysimeters, wells, and surface-water sites used for this study.)

LOCATION.—Hydrologic Unit 05040001, approximately 1.5 mi northwest of the city of Dover, Ohio; 0.5 mi west of Interstate 77.
AQUIFER.—Sandstones and coals of Allegheny and Pottsville Groups, of middle and lower Pennsylvanian Age.

AQUFER.—Sandstones and coals of Allegheny and Pottsville Groups, of middle and lower Pennsylvanian Age.
INSTRUMENTATION.—Periodic measurement of water level with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is given in feet above sea level, surveyed using Total Station with reference points established by global positioning system, accurate to 0.01 ft.

PERIOD OF RECORD.—Mar. 1995 to June 1998 for wells TU-100 through TU-114; Dec. 1995 to June 1998 for wells TU-115 through TU-119.

PERIOD OF RECORD: April 1993 to June 1996 for wells 1C-100 through 1C-120;
Measurement of water levels and water-quality sampling resumed again in May 2000.

REMARKS.—These sites are used for chemical-quality sampling only as part of a cooperative study with the Ohio Department of Natural Resources, West Virginia University, and the Ohio Minelands Partnership.

The following tables contain daily maximum ground-water levels and temperature from three monitoring wells on former Air Force Plant 36 in Evendale, Ohio. These data were collected as part of a cooperative study with U.S. Air Force Aeronautical Systems Center headquartered at Wright-Patterson Air Force Base. The purpose of the study is to provide technical support for ongoing remedial actions at the plant.

PROJECT DATA
Ground-Water Records for Former Air Force Plant 36

391408084264100. LOCAL NUMBER, AF-5S

LOCATION.—Latitude 39°14'08", longitude 84°26'41", Hamilton County, Hydrologic Unit 05090203.

AQUIFER.—Shallow part of glacial outwash. Geologic Unit 112OTSH.

WELL CHARACTERISTICS.—Drilled observation water well, depth 51.0 ft.

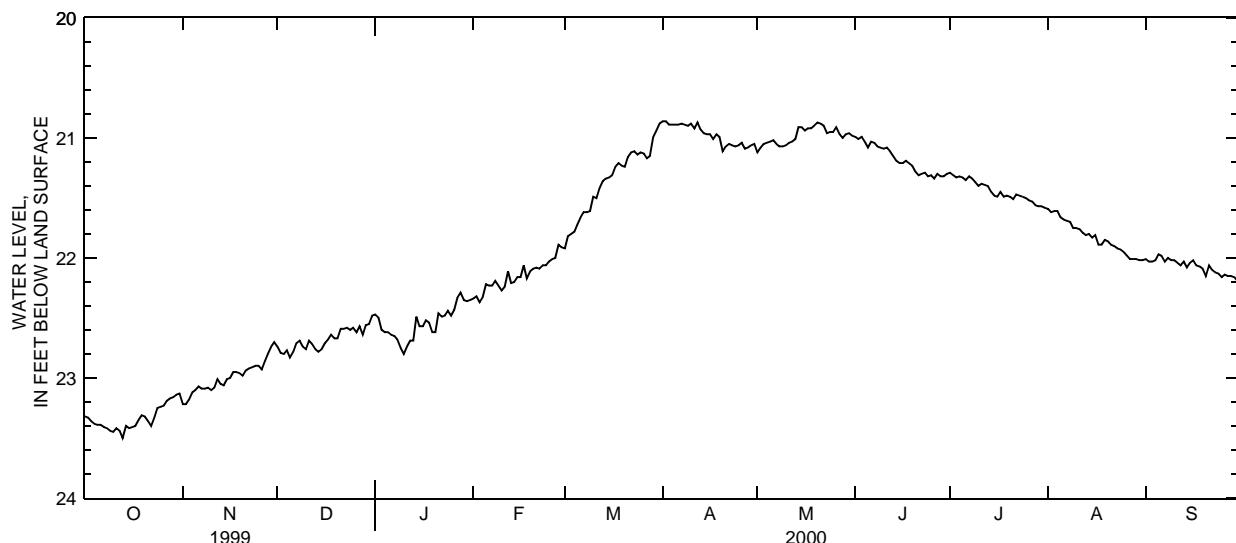

DATUM.—Altitude of land surface is 559.90 feet above National Geodetic Vertical Datum of 1929. Measuring point is top of inner casing, 2.09 ft above land-surface datum.

PERIOD OF RECORD.—Nov. 1997 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 23.50 ft below land-surface datum, Oct. 13, 1999; minimum daily low, 18.69 ft below land-surface datum, July 19, 1998.

PROJECT DATA
Ground-Water Records for Former Air Force Plant 36

391408084264101. LOCAL NUMBER, AF-5P

LOCATION.—Latitude 39°14'08", longitude 84°26'41", Hamilton County, Hydrologic Unit 05090203.

AQUIFER.—Perched part of glacial outwash. Geologic Unit 112OTSH.

WELL CHARACTERISTICS.—Drilled observation water well, depth 33.0 ft.

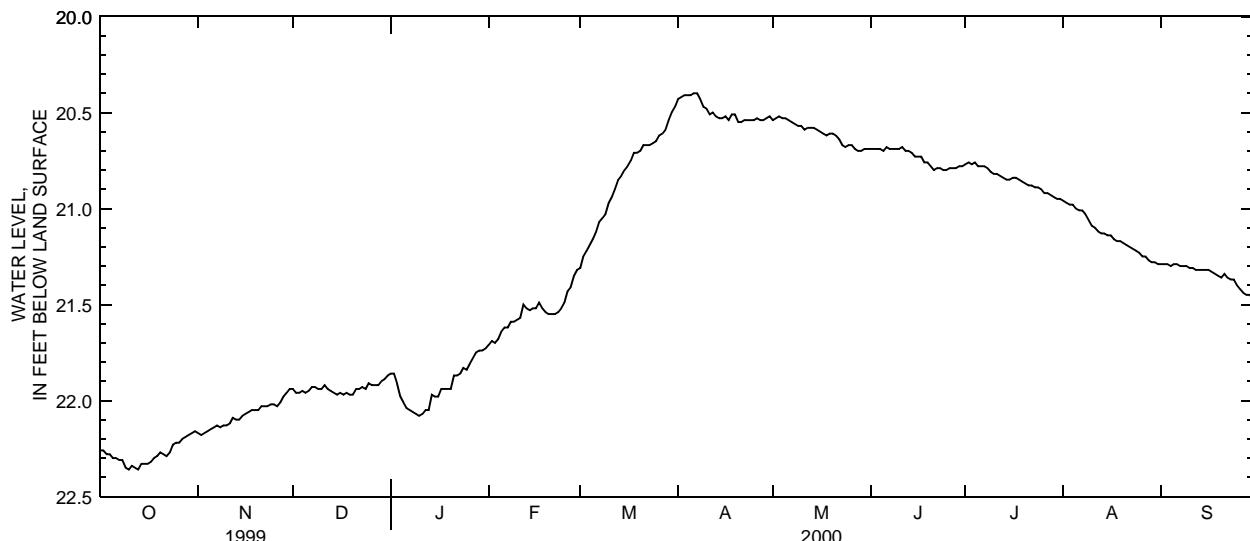

DATUM.—Altitude of land surface is 559.90 feet above National Geodetic Vertical Datum of 1929. Measuring point is top of inner casing, 1.34 ft above land-surface datum.

PERIOD OF RECORD.—Nov. 1997 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 22.36 ft below land-surface datum, Oct. 10 and 13, 1999; minimum daily low, 19.49 ft below land-surface datum, June 6-8, 1998.

PROJECT DATA
Ground-Water Records for Former Air Force Plant 36

391411084264000. LOCAL NUMBER, AF-3S

LOCATION.—Latitude 39°14'11", longitude 84°26'40", Hamilton County, Hydrologic Unit 05090203.

AQUIFER.—Shallow part of glacial outwash. Geologic Unit 112OTSH.

WELL CHARACTERISTICS.—Drilled observation water well, depth 52.0 ft.

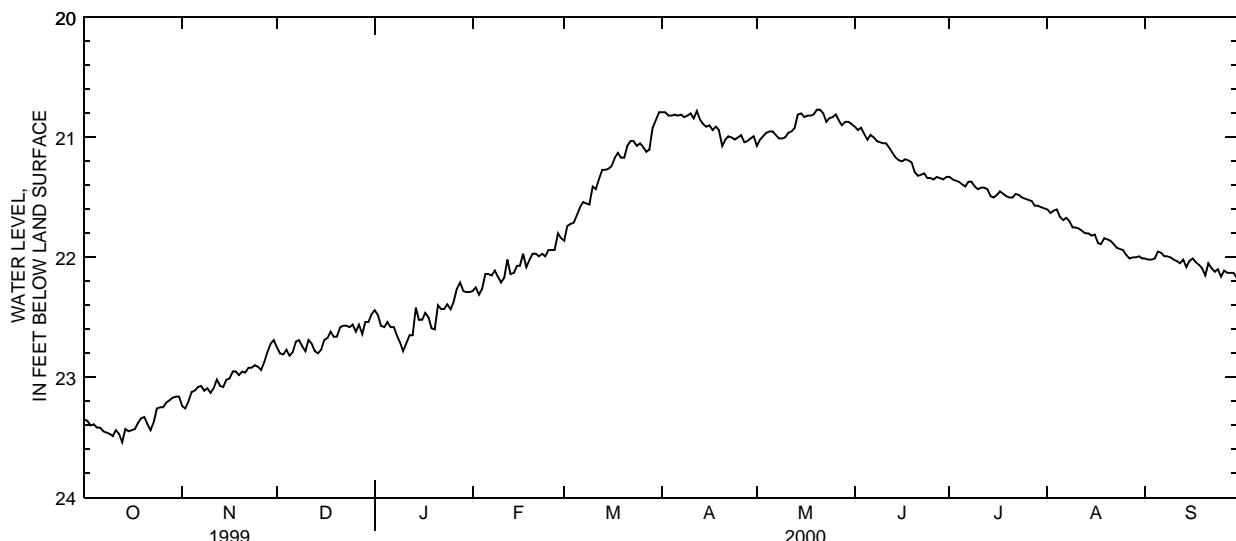

DATUM.—Altitude of land surface is 560.40 feet above National Geodetic Vertical Datum of 1929. Measuring point is top of inner casing, 1.94 ft above land-surface datum.

PERIOD OF RECORD.—Nov. 1997 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 23.54 ft below land-surface datum, Oct. 13, 1999; minimum daily low, 19.25 ft below land-surface datum, June 7 and 8, 1998.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

The following tables contain ground-water-level and ground-water-quality data collected as part of a USGS cooperative study with the Geauga County Planning Commission and the Board of County Commissioners. Data-collection sites are shown below.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

135

LONG-TERM GROUND-WATER MONITORING NETWORK

Ground-water-level measurements from the 32 wells that comprise the long-term ground-water monitoring network in Geauga County are shown on the following pages. The purpose of the water-level study is to determine whether fluctuations in water levels represent consistent, long-term trends caused by human activity or are predominantly the result of seasonal and annual variations in recharge. Land-surface datums are accurate within ± 5 ft. Water levels known to have been measured after a well had been recently pumped are designated with an asterisk (*).

412331081123000. LOCAL NUMBER, GE-22

LOCATION.—Latitude 41°23'31", longitude 81°12'30", Geauga County, west of Valley View Road by La Due Reservoir at old Sugar House, Auburn Township. Owner City of Akron.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Water-supply well located in pit, not currently in use; diameter 6.25 in., depth 80 ft.

INSTRUMENTATION.—Pressure transducer and CR10 data logger (records hourly) with SM192 storage module.

DATUM.—Elevation of land-surface datum is 1,160 ft above sea level. Measuring point: mark on wooden base of instrument shelter; changed from 3.96 ft below land-surface datum to 3.20 ft above land-surface datum on May 13, 1997.

PERIOD OF RECORD.—Periodic water-level measurements from June 8, 1978 through September 8, 1994. Continuous water-level data from July 24, 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 11.26 ft below land-surface datum, June 2, 1997; lowest measured, 14.34 ft below land-surface datum, Nov. 12, 1980.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

412331081123000. LOCAL NUMBER, GE-22—Continued

412309081202400. LOCAL NUMBER, GE-23

LOCATION.—Latitude 41°23'09", longitude 81°20'24", Geauga County, Alltel building on Bainbridge Road, west of State Route 306, Bainbridge Township. Owner: Alltel Telephone Company.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Commercial water-supply well; diameter 5.63 in., depth 40 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 1,162 ft above sea level. Measuring point: top of casing, 1.32 ft above land-surface datum.

PERIOD OF RECORD.—April 26, 1978 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 10.46 ft below land-surface datum, Apr. 26, 1978; lowest measured, 19.48* ft below land-surface datum, Aug. 29, 2000.

| 08/29/00 | 19.48* |

413138081152000. LOCAL NUMBER, GE-76

LOCATION.—Latitude 41°31'38", longitude 81°15'20", Geauga County, 10755 Mayfield Road, Munson Township. Owner: Fowler's Mill Christian Church.

AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Private water-supply well; diameter 6.0 in., depth 150 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 1,170 ft above sea level. Measuring point: top of casing, 1.68 ft above land-surface datum.

PERIOD OF RECORD.—June 15, 1978 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 21.19 ft below land-surface datum, June 15, 1978; lowest measured, 25.02 ft below land-surface datum, Jan. 4, 2000.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

412627081075400. LOCAL NUMBER, GE-83

LOCATION.—Latitude 41°26'27", longitude 81°07'54", Geauga County, 15776 Jug Street, Burton Township. Owner: privately owned.
AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Domestic water-supply well; diameter 6.0 in., depth 70 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 1,220 ft above sea level. Measuring point: top of casing, 1.00 ft above land-surface datum.

PERIOD OF RECORD.—June 14, 1978 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 27.59 ft below land-surface datum, Aug. 14, 1985; lowest measured, 36.45 ft below land-surface datum, Feb. 28, 2000.

412748081143900. LOCAL NUMBER, GE-91

LOCATION.—Latitude 41°27'48", longitude 81°14'39", Geauga County, northeast corner of Auburn Road and State Route 87 intersection, Newbury Township. Owner: Dairy Mart.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Commercial water-supply well; diameter 5.63 in., depth 85 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 1,250 ft above sea level. Measuring point: top of casing, 1.16 ft above land-surface datum.

PERIOD OF RECORD.—October 19, 1978 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 40.10 ft below land-surface datum, Oct. 19, 1978; lowest measured, 46.79 ft below land-surface datum, Feb. 28, 2000.

LOCATION.—Latitude 41°37'57", longitude 81°12'23", Geauga County, 12080 Clark Road, Chardon Township. Owner: privately owned.

AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Domestic water-supply well; diameter 6.25 in., depth 48 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 990 ft above sea level. Measuring point: top of casing, 0.90 ft above land-surface datum.

PERIOD OF RECORD.—May 7, 1980 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 20.81 ft below land-surface datum, Mar. 17, 1997; lowest measured, 25.09 ft below land-surface datum, Oct. 20 and Dec. 15, 1998.

LOCATION.—Latitude 41°32'07", longitude 81°04'44", Geauga County, by golf course maintenance building at 15900 Mayfield Road, Huntsburg Township. Owner: Rolling Green Golf Course.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Commercial water-supply well for shop and house (not used for irrigation); diameter 5.63 in., depth 80 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 1,265 ft above sea level. Measuring point: top of casing, 1.30 ft above land-surface datum.

PERIOD OF RECORD.—May 8, 1980 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 43.86 ft below land-surface datum, May 5, 1980; lowest measured, 49.47 ft below land-surface datum, May 2, 2000.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

413630081145001. LOCAL NUMBER, GE-185A

LOCATION.—Latitude 41°36'30", longitude 81°14'50", Geauga County, 9673 Mentor Road, Chardon Township. Owner: privately owned.

AQUIFER.—Cuyahoga Group (interbedded shales and sandstones) of Mississippian age.

WELL CHARACTERISTICS.—Domestic water-supply well; diameter 5.5 in., depth 90 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 1,260 ft above sea level. Measuring point: top of casing 0.84 ft above land-surface datum.

PERIOD OF RECORD.—January 1, 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 32.39 ft below land-surface datum, Nov. 21, 1996; lowest measured, 37.19 ft below land-surface datum, Dec. 15, 1998.

413607081032500. LOCAL NUMBER, GE-202

LOCATION.—Latitude 41°36'07", longitude 81°03'25", Geauga County, 9999 Plank Road, Montville Township. Owner: privately owned.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Domestic water-supply well; diameter 5.63 in., depth 74 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 1,247 ft above sea level. Measuring point: top of casing, 1.60 ft above land-surface datum.

PERIOD OF RECORD.—February 10, 1986 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 27.60 ft below land-surface datum, Feb. 10, 1986; lowest measured, 30.81 ft below land-surface datum, Oct. 27, 1999.

413357081214800. LOCAL NUMBER, GE-255

LOCATION.—Latitude 41°33'57", longitude 81°21'48", Geauga County, 11240 Caves Road, Chester Township. Owner: privately owned.

AQUIFER.—Berea Sandstone of Mississippian age.

WELL CHARACTERISTICS.—Domestic water-supply well; diameter 5.63 in., depth 123 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—elevation of land-surface datum is 1,075 ft above sea level. measuring point: Top of casing, 2.08 ft above land-surface datum.

PERIOD OF RECORD.—September 8, 1994 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 51.32 ft below land surface datum, May 14, 1997; lowest measured, 54.24 ft below land-surface datum, July 17, 2000.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

413247081103300. LOCAL NUMBER, GE-349

LOCATION.—Latitude 41°32'47", longitude 81°10'33", Geauga County, 121 Berkshire Drive, Aquilla Village, Claridon Township. Owner: privately owned.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Domestic water-supply well, not currently in use; diameter 5.63 in., depth 58.19 ft.

INSTRUMENTATION.—Pressure transducer and CR10 data logger (records hourly) with SM192 storage module.

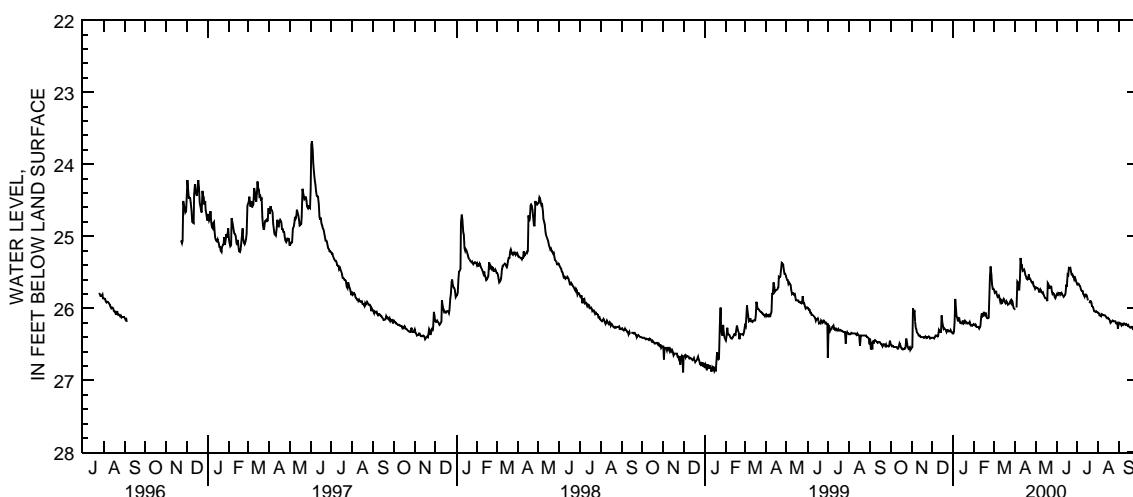

DATUM.—Elevation of land-surface datum is 1,190 ft above sea level. Measuring point: mark on wooden base of instrument shelter, 1.05 ft above land-surface datum.

PERIOD OF RECORD.—July 24, 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 23.68 ft below land-surface datum, June 3, 1997; lowest measured, 26.89 ft below land-surface datum, Nov. 30, 1998.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

147

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

412322081190000. LOCAL NUMBER, GE-350

LOCATION.—Latitude 41°23'32", longitude 81°19'00", Geauga County, 9100 Bainbridge Road, Bainbridge Township. Owner: privately owned.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Domestic water-supply well, not currently in use; diameter 6.0 in., depth 59.87 ft.

INSTRUMENTATION.—Pressure transducer and CR10X data logger (records hourly).

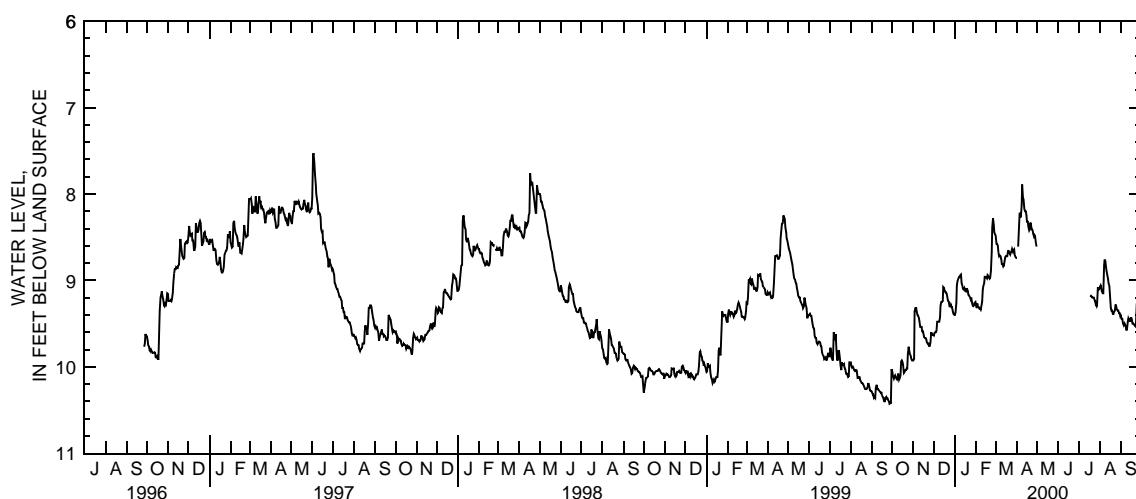

DATUM.—Elevation of land-surface datum is 1,120 ft above sea level. Measuring point: mark on wooden base of instrument shelter, 0.77 ft above land-surface datum.

PERIOD OF RECORD.—September 26, 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 7.53 ft below land-surface datum, June 3, 1997; lowest measured, 10.41 ft below land-surface datum, Sept. 27, 1999.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

413119081213200. LOCAL NUMBER, GE-351

LOCATION.—Latitude 41°31'19", longitude 81°21'32", Geauga County, south side of S.R. 322, east of intersection with Caves Road and west of Bloom Brothers Hardware, Chester Township. Owner: privately owned.

AQUIFER.—Cuyahoga Group (interbedded shales and sandstones) of Mississippian age.

WELL CHARACTERISTICS.—Domestic water-supply well, not currently in use; diameter 6 in., depth 126.5 ft.

INSTRUMENTATION.—Pressure transducer and CR10X data logger (records hourly).

DATUM.—Elevation of land-surface datum is 1,135 ft above sea level. Measuring point: mark on wooden base of instrument shelter, 1.25 ft above land-surface datum.

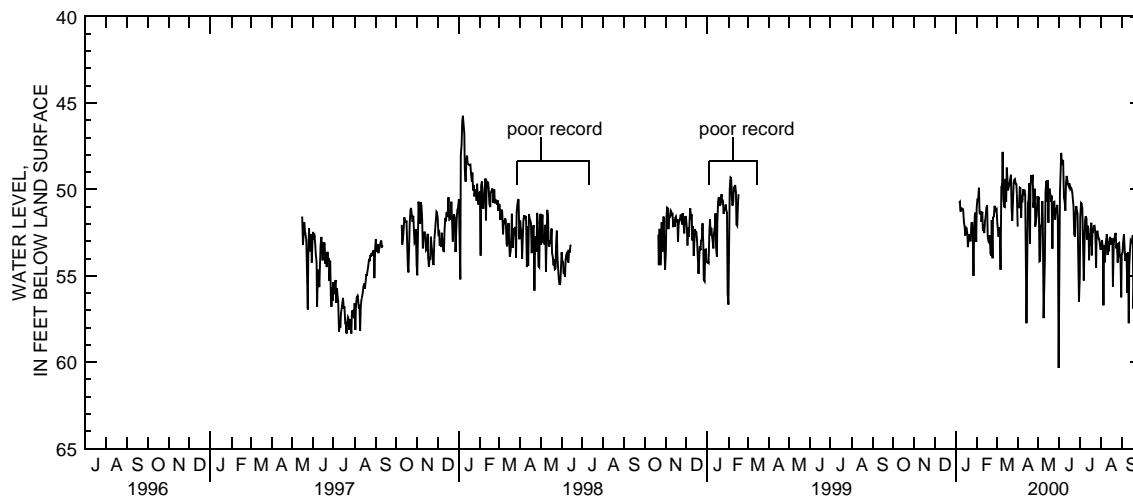

PERIOD OF RECORD.—May 15, 1997 through February 16, 1999.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 45.75 ft below land-surface datum, Jan. 7, 1998; lowest measured, 60.33 ft below land-surface datum, May 31, 2000.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

412851081045200. LOCAL NUMBER, GE-352

LOCATION.—Latitude 41°28'51", longitude 81° 04'52", Geauga County, west side of State Route 608, north of Middlefield Village, by hunters' parking lot, Middlefield Township. Owner: City of Akron.

AQUIFER.—Glacial deposits of Quaternary age.

WELL CHARACTERISTICS.—Domestic water-supply well, not currently in use; diameter 6 in., depth 122.3 ft.

INSTRUMENTATION.—Pressure transducer and CR10X data logger (records hourly).

DATUM.—Elevation of land-surface datum is 1,140 ft above sea level. Measuring point: mark on wooden base of instrument shelter, 1.15 ft above land-surface datum.

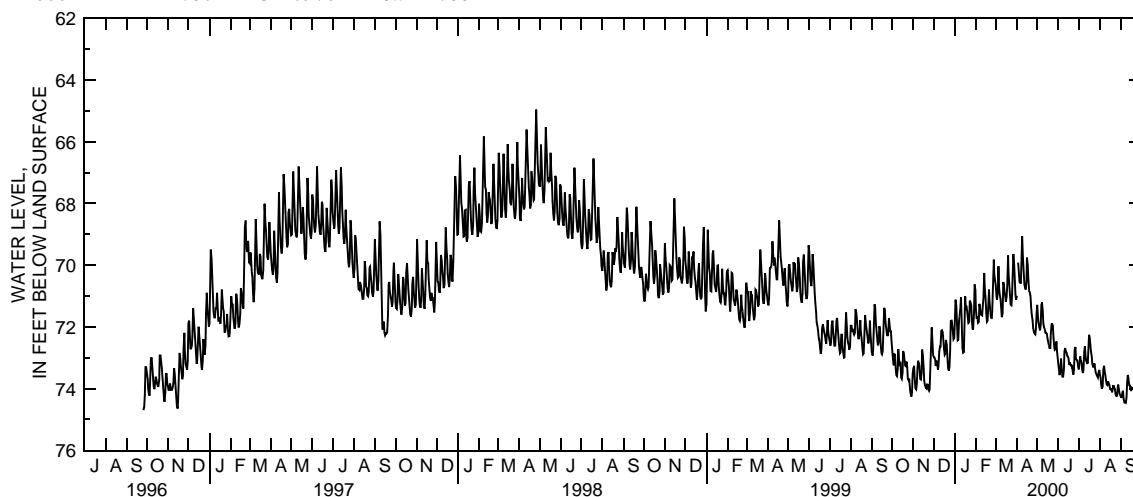

PERIOD OF RECORD.—September 25, 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 64.96 ft below land-surface datum, Apr. 26, 1998; lowest measured, 74.80 ft below land-surface datum, Sept. 25, 1996.

PROJECT DATA
Ground-Water Data for Geauga County, Ohio

LONG-TERM GROUND-WATER MONITORING NETWORK—CONTINUED

412748081172000. LOCAL NUMBER, GE-354

LOCATION.—Latitude 41°27'48", longitude 81°17'20", Geauga County, northwest corner of intersection of Sperry Road and State Route 87, Newbury Township. Owner: privately owned.

AQUIFER.—Pottsville Formation (sandstone) of Pennsylvanian age.

WELL CHARACTERISTICS.—Domestic water-supply well, not currently in use; diameter 6.0 in., depth 113.9 ft.

INSTRUMENTATION.—Pressure transducer and CR10X data logger (records hourly).

DATUM.—Elevation of land-surface datum is 1,275 ft above sea level. Measuring point: mark on wooden base of instrument shelter, 4.15 ft above land-surface datum.

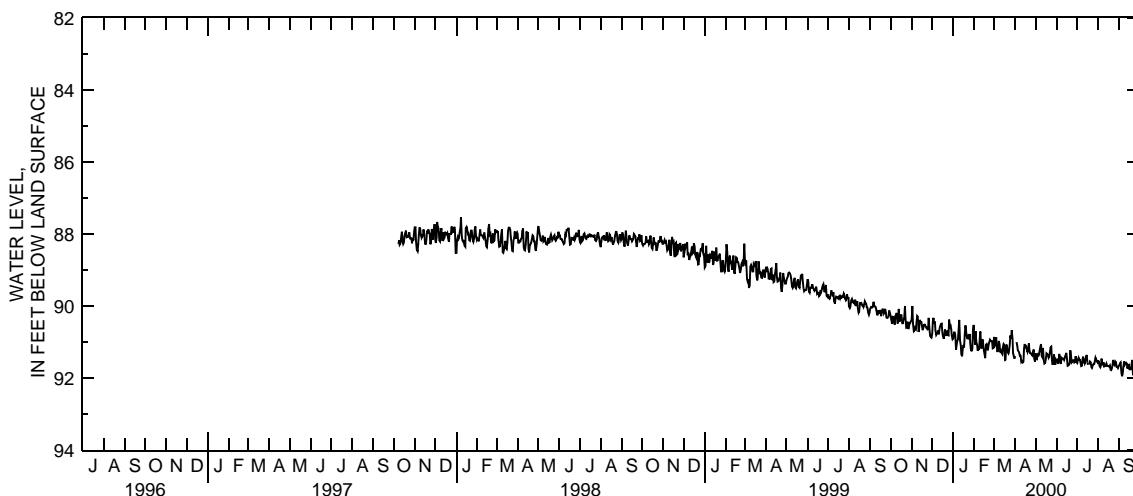

PERIOD OF RECORD.—October 7, 1997 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 87.53 ft below land-surface datum, Jan. 8, 1998; lowest measured, 91.95 ft below land-surface datum, Sept. 5, 2000.

Low-Flow Magnitude and Frequency of Ohio Streams

The low-flow network is part of a cooperative study with the Ohio Department of Natural Resources to define the low-flow characteristics of 180 sites that have essentially unregulated streamflow and drainage areas less than 150 square miles. The following table lists the sites of the low-flow partial record network including discharge measurements made in the 2000 water year. The second table lists the discontinued streamflow-gaging stations for which a discharge measurement was performed in 2000 that were used for index stations for this project. The discontinued stations are not shown.

PROJECT DATA
Low-Flow Magnitude and Frequency of Ohio Streams

LOW-FLOW PARTIAL-RECORD STATIONS

[mi², square miles; ft³/s, cubic feet per second; --, no data]

| Station number | Station name | Location | Drainage area (mi²) | Period of record | Measurements | |
|-------------------------------------|---|---|---------------------------------------|-------------------------|---------------------|-------------------------------------|
| | | | | | Date | Discharge (ft³/s) |
| BEAVER RIVER BASIN | | | | | | |
| 03098390 | Mill Creek near Youngstown, Ohio | Latitude 41°02'00", longitude 80°41'37", Mahoning County, Hydrologic Unit 05030103, at pedestrian bridge over Mill Creek at end of extra parking lot next to Mill Creek Park Golf Course, 0.75 northeast of park entrance at State Route 224, 0.75 mi downstream of Indian Run, 3.1 mi upstream of Newport Lake Dam, 3 mi southwest of South Side Youngstown, Ohio. (Youngstown 1:24000 quad) | 51.5 | 1995-99 | -- | -- |
| SUNFISH CREEK BASIN | | | | | | |
| 03114241 | Sunfish Creek at Coats, Ohio | Latitude 39°46'14", longitude 81°02'34", Monroe County, Hydrologic Unit 05030201, at riffle beside Sunfish Creek Road, 800 ft downstream from confluence of unnamed tributary, 0.7 mi downstream from confluence of Standingstone Run, 1.0 mi southeast of Coats, 4.0 mi east of Woodsfield, Ohio. (Woodsfield 1:24000 quad) | 51.3 | 1995-1997-99 | -- | -- |
| LITTLE MUSKINGUM RIVER BASIN | | | | | | |
| 03115385 | Clear Fork near Rinard Mills, Ohio | Latitude 39°36'08", longitude 81°09'17", Monroe County, Hydrologic Unit 05030201, at State Route 26 bridge over Clear Fork, 0.3 mi above confluence with Little Muskingum River, 1.2 mi north of Rinard Mills, Ohio. (Rinard Mills 1:24000 quad) | 48.8 | 1997-99 | -- | -- |
| MUSKINGUM RIVER BASIN | | | | | | |
| 03123166 | South Fork Sugar Creek near Sugarcreek, Ohio | Latitude 40°31'25", longitude 81°36'52", Tuscarawas County, Hydrologic Unit 05040001, at Tuscarawas County Road 75, 0.2 mi downstream from confluence with East Branch, 0.2 mi northeast of Sugarcreek, Ohio. (Strasburg 1:24000 quad) | 63.3 | 1997-00 | 09/20/00 | 6.39 |
| 03123299 | Walnut Creek at Dundee, Ohio | Latitude 40°35'12", longitude 81°37'16", Tuscarawas County, Hydrologic Unit 05040001, at private road bridge, 0.5 mi upstream from mouth, 0.7 mi west of Dundee, Ohio. (Strasburg 1:24000 quad) | 48.0 | 1997-00 | 09/20/00 | 4.30 |
| 03129205 | Black Fork Mohican River near Shelby, Ohio | Latitude 40°54'57", longitude 82°38'02", Richland County, Hydrologic Unit 05040002, at bridge on Plymouth-Spring Road, 0.3 mi downstream from Bear Run, 2.8 mi northeast of Shelby, 2000 ft north of London, Ohio. (Shelby 1:24000 quad) | 60.4 | 2000 | 09/20/00 | 5.46 |
| 03133950 | Jerome Fork near Ashland, Ohio | Latitude 40°53'02", longitude 82°17'03", Ashland County, Hydrologic Unit 05040002, at bridge on U.S. Highway 42, 0.7 mi upstream from Lang Creek, 2.0 mi northeast of Ashland, 1,000 ft north of Cleveland Avenue, concrete block building on downstream, left of bridge (gray-no paint), at entrance to well-field. (Ashland North 1:24000 quad) | 38.6 | 2000 | 09/20/00 | 0.79 |

PROJECT DATA

**Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)**

The data described in the following table were collected and analyzed as part of the NAWQA (National Water-Quality Assessment Program) project in the Great Miami and Little Miami River Basins. The objectives of the NAWQA program are to broadly characterize the water quality of the Nation's streams and aquifers in relation to human and natural factors. The period of high-intensity data collection for the Great Miami and Little Miami River Basins project is in water years 1999-2001.

Data for eight stream sites in Ohio are being reported in this publication as part of the NAWQA study: Little Miami River at Milford, Ohio (03245500), East Fork Little Miami River near Williamsburg, Ohio (03246400), Mad River at St. Paris Pike near Springfield, Ohio (03267900), Great Miami River at Hamilton, Ohio (03274000), Great Miami River at Venice, Ohio (03274500), Holes Creek at Huffman Park near Kettering, Ohio (393944084120700), Stillwater River at Martindale Road near Union, Ohio (395355084173600), and Great Miami River near Vandalia, Ohio (395457084095100). One site is reported in the 2000 Indiana annual data report: Whitewater River near Alpine, Indiana (03275000).

These data also can be obtained electronically at: <http://oh.water.usgs.gov/miam.html>.

(National Water-Quality Assessment Program)
WATER-QUALITY RECORDS—CONTINUED

03267900 MAD RIVER AT ST. PARIS PIKE NEAR EAGLE CITY, OHIO

LOCATION.—Latitude 39°57'51", longitude 83°49'54", Clark County, Hydrologic Unit 05080001, and at mile 28.8.

DRAINAGE AREA.—310 mi².

REMARKS.—This station is maintained by the Miami Conservancy District. Discharge is measured at this site and published in volume 1, surface-water records.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

[µS/cm, microsiemens per centimeter; (00095), USGS National Water Information System parameter code; deg C, degrees Celsius; mm of Hg, millimeters of mercury; mg/L, milligrams per liter; col/100mL; colonies per 100 milliliters; µg/L, micrograms per liter; --, no data]

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
WATER-QUALITY RECORDS—CONTINUED

03274000 GREAT MIAMI RIVER AT HAMILTON, OHIO

LOCATION.—Latitude 39°23'28", longitude 84°34'20", Butler County, Hydrologic Unit 05080002, at mile 34.8.

DRAINAGE AREA.—3,630 mi².

REMARKS.—Sampling was temporarily moved downstream to Great Miami River at Venice, Ohio (03274500) during bridge construction at this site. Discharge is measured at this site and published in volume 1, surface-water records.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

[$\mu\text{S}/\text{cm}$, microsiemens per centimeter; (00095), USGS National Water Information System parameter code; deg C, degrees Celsius; mm of Hg, millimeters of mercury; mg/L, milligrams per liter; --, no data; col/100mL; colonies per 100 milliliters; <, concentration or value reported is less than that indicated; k, value is estimated from a non-ideal colony count; IT, incremental titration]

| Date | Time | Specific conductance, field ($\mu\text{S}/\text{cm}$) (00095) | Specific conductance, lab ($\mu\text{S}/\text{cm}$) (90095) | pH, whole water field (standard units) (00400) | pH, whole water lab (standard units) (00403) | Water temperature, deg C (00010) | Air temperature, deg C (00020) | Barometric pressure, mm of Hg (00025) | Dissolved oxygen (mg/L) (00300) |

(National Water-Quality Assessment Program)
WATER-QUALITY RECORDS—CONTINUED

393944084120700 HOLES CREEK AT HUFFMAN PARK NEAR KETTERING, OHIO

LOCATION.—Latitude 39°39'44", longitude 84°12'07", Montgomery County, Hydrologic Unit 05080001, and at mile 2.6.

DRAINAGE AREA.—20.0 mi².

REMARKS.—Twenty-four discharge measurements were made at this site. Streamflow computed from these measurements is reported below.

Continuous stage data is collected at Holes Creek at Mad River Road (03271300), a station 0.6 mi upstream of the sampling site that is maintained by the Miami Conservancy District.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

[ft³/s, cubic feet per second; (00061), USGS National Water Information System parameter code; µS/cm, microsiemens per centimeter; deg C, degrees Celsius; mm of Hg, millimeters of mercury; <, concentration or value reported is less than that indicated; --, no data; mg/L, milligrams per liter; k, value is estimated from a non-ideal colony count]

| Date | Time | Discharge, instantaneous (ft/s ³) (00061) | Specific conductance, field (µS/cm) (00095) | Specific conductance, lab (µS/cm) (90095) | pH, whole water field (standard units) (00400) | pH, whole water lab (standard units) (00403) | Water temperature, (deg C) (00010) | Air temperature, (deg C) (00020) | Barometric pressure, (mm of Hg) (00025) | |

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
WATER-QUALITY RECORDS—CONTINUED

395355084173600 STILLWATER RIVER AT MARTINDALE ROAD NEAR UNION, OHIO

LOCATION.—Latitude 39°53'55", longitude 84°17'36", Montgomery County, Hydrologic Unit 05080001, and at mile 11.4.
DRAINAGE AREA.—645.7 mi².

REMARKS.—Discharge is not measured at this site. Discharge is measured by the Miami Conservancy District 2.5 mi downstream at Stillwater River at Englewood, Ohio (03266000) and is published in volume 1, surface-water records. The site at Martindale Road was inaccessible for the collection of the Apr. 8, 2000 sample because of high water. This sample (flagged with an asterisk (*) in the table) was collected at Frederick-Garland Road (395611084180600), a site 3.6 mi upstream from the Martindale Road site.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

[µS/cm, microsiemens per centimeter; (00061), USGS National Water Information System parameter code; deg C, degrees Celsius; mm of Hg, millimeters of mercury; mg/L, milligrams per liter; --, no data; col/100mL; colonies per 100 milliliters; <, concentration or value reported is less than that indicated]

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
WATER-QUALITY RECORDS—CONTINUED

395457084095100 GREAT MIAMI RIVER AT ROSS ROAD NEAR VANDALIA, OHIO

LOCATION.—Latitude 39°54'57", longitude 84°09'51", Montgomery and Miami Counties, Hydrologic Unit 05080001, and at mile 95.7.

DRAINAGE AREA.—1142 mi².

REMARKS.—Discharge is not measured at this site. Discharge is measured by the Miami Conservancy District 4.8 miles downstream at Great Miami River at Taylorsville, Ohio (03263000).

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

[$\mu\text{S}/\text{cm}$, microsiemens per centimeter; (00061), USGS National Water Information System parameter code; deg C, degrees Celsius; mm of Hg, millimeters of mercury; mg/L, milligrams per liter; --, no data; col/100mL; colonies per 100 milliliters; IT, incremental titration; <, concentration or value reported is less than that indicated]

| Date | Time | Specific conductance, field ($\mu\text{S}/\text{cm}$) (00095) | Specific conductance, lab ($\mu\text{S}/\text{cm}$) (90095) | pH, whole water field (standard units) (00400) | pH, whole water lab (standard units) (00403) | Air temperature, (deg C) (00020) | Water temperature, (deg C) (00010) | Barometric pressure, (mm of Hg) (00025) | Oxygen, dissolved (mg/L) (00300) |

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
FISH-COMMUNITY RESULTS

Fish-community surveys were conducted at three sites in the Great and Little Miami River Basins as part of the National Water-Quality Assessment Program (NAWQA). The sites were sampled as part of a multiyear assessment to estimate year-to-year variability. Additional reaches (indicated below as B and C) were sampled at Holes Creek and Mad River sites to estimate reach-to-reach variability within a single stream. Fish were collected by electrofishing with pulsed-DC current in a mapped reach at each site. Two electrofishing passes were done at each reach in a single day. Electrofishing was done by use of a barge electroshocker at all reaches excluding the Great Miami River below Hamilton, Ohio, where non-wadeable stream depths also required the use of a boat. Fish were identified, measured, weighed, and checked for external anomalies such as parasites, lesions, and skeletal anomalies. Fish were identified in the field by Dr. Terry Keiser, Ohio Northern University, and representative specimens were preserved, identified, and vouchered at the university. More details regarding collection methods can be found in Meador and others (1993). Taxonomy is based on Robins and others (1991).

CALENDAR YEAR 2000

[mi², square miles; µS/cm, microsiemens per centimeter; (00095), USGS National Water Information System parameter code; deg C, degrees Celsius; mg/L, milligrams per liter; --, no data]

| Station number | Station name | Date | Drainage area (mi ²) | Reach length (meters) | Specific conductance, field (µS/cm) (00095) | pH, whole water field [standard units] (00400) | Water temperature, (deg C) (00010) | Oxygen, dissolved (mg/L) (00300) |

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
RESULTS FROM THE STILLWATER RIVER BASIN SYNOPTIC

The Great and Little Miami River Basins NAWQA (MIAM) study conducted a synoptic study to investigate the water quality of streams in the Stillwater River Basin, Darke and Miami Counties, Ohio. Land use in the Stillwater River Basin is largely agricultural and includes extensive row-crop production of corn, soybeans, and winter wheat, as well as extensive production of poultry, swine, and to a lesser extent, dairy cattle. Because most poultry and swine production is associated with animal feedlot operations (AFOs), the Stillwater River Basin has the highest density of AFOs in the MIAM study unit. The water samples were collected at 30 sites during a single high-flow event that occurred in May 2000. Stream samples were collected from one depth-integrated vertical taken at the stream's centroid of flow with a 3-liter teflon bottle. At most sites, stream discharge measurements were taken immediately after sample collection. A churn splitter was used to composite and split the inorganic samples. Samples were collected for analysis of selected physical parameters, major ions, nutrients, and selected pesticides. Specific details describing the guidelines used for sample collection and processing can be found in Wilde and others (1999).

Streambed-sediment samples were collected during low-flow conditions in the Stillwater River Basin at 28 sites in August and September, 2000. Bed-sediment samples were collected from the top 1 to 2 centimeters of material taken from at least 5 depositional areas within the stream reach. The composite samples were wet-sieved using a 2.0-millimeter stainless steel mesh (WS <2 mm) and submitted to the laboratory for carbon content analyses. Details concerning procedures used to collect and process streambed sediment samples are given in Shelton and Capel (1994). Bed-sediment constituent concentrations are provided on a dry-weight (DW) basis.

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
CHLOROPHYLL AND NUTRIENTS MEASUREMENTS

Field measurements of water quality and samples of algal chlorophyll *a* and *b* were taken from the water column (phytoplankton) and from the stream bottom (periphyton) in riffles representing the richest-targeted habitat and depositional-targeted habitats as defined in the NAWQA algal protocols (Porter, S.D., Cuffney, T.F., Gurtz, M.E., and Meador, M.R., 1993, Methods for collecting algal samples as part of the National Water-Quality Assessment Program: U.S. Geological Survey Open-file Report 93-409, 39 p.). Partial support to collect these data was provided by the U.S. Environmental Protection Agency as a collaborative study to provide data on stream nutrient and algal conditions for the development of nutrient criteria. In some cases, the nutrient samples were collected at the water-quality gaging station near the ecological station. Those sites that are in close proximity are:

Stillwater River at Martindale Road near Union, Ohio, (395355084173600) and Stillwater River at Old Springfield Road near Union, Ohio (395433084175300),
Great Miami River at Ross Road near Vanadalia, Ohio (395457084095100) and Great Miami River near Tipp City, Ohio, (395534084091400)
Mad River at St. Paris Pike at Eagle City, Ohio (03267900) and Mad River near Highway 41 near Springfield, Ohio (395650083504400).

WATER-QUALITY DATA

(National Water-Quality Assessment Program)
CHLOROPHYLL AND NUTRIENTS MEASUREMENTS—CONTINUED

Selected water-quality parameters including water temperature, pH, specific conductance, dissolved oxygen and in vivo chlorophyll were monitored at 15-minute intervals for approximately 48 hours at selected sites in July 2000. Data collection was done by use of multi-probe data sondes. Data collection was done to measure diurnal fluctuations in these parameters in relation to in-stream productivity, nutrient concentrations, and habitat features at each site. Partial support to collect these data was provided by the U.S. Environmental Protection Agency and YSI Incorporated (Yellow Springs, Ohio) as a collaborative study to provide data on stream nutrient and algal conditions for the devolment of nutrient criteria.

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
GROUND-WATER DATA COLLECTED AT SPECIAL STUDY SITES
 (Results from selected sites in the Great and Little Miami River Basin)

AGRICULTURAL LAND-USE STUDY

The following tables contain water-level and water-quality data collected for ground-water studies by the Great and Little Miami River Basins NAWQA (National Water-Quality Assessment) Project. A network of 26 shallow and 8 intermediate depth monitor wells were installed and sampled in spring-summer 2000 as part of an Agricultural Land-Use study. NAWQA Land-Use studies focus on the quality of recently recharged ground water so that the influence of land-use practices and natural conditions can be assessed. In this study, monitor wells were installed at randomly selected locations where row-crop production of corn and soybeans overlies the Buried Valley Aquifer System (BVAS). The BVAS consists of highly permeable sand and gravel deposits that filled in buried ancestral river valleys. The BVAS supplies the greatest quantity of water in the area and has been designated a sole-source aquifer by the U.S. Environmental Protection Agency.

Water samples from the monitor wells were tested for physical characteristics, nutrients, major and trace elements, and pesticides. General site and well characteristics data, sampling date and time, water-level records and physical characteristics are presented first. These are followed by nutrient, major ion, trace element, and pesticide data.

PROJECT DATA
Results from Selected Sites in the Great Miami and Little Miami River Basin
(National Water-Quality Assessment Program)
MIAMI CONSERVANCY DISTRICT GROUND-WATER PRESERVATION COOPERATIVE PROJECT

PESTICIDE DATA

A network of 15 public supply wells was sampled in summer 1999 in cooperation with the Miami Conservancy District's Groundwater Preservation Program. The network was designed to target public supply wells in the Buried-Valley Aquifer System (BVAS) that are vulnerable to induced infiltration. Induced infiltration occurs when some fraction of the ground water pumped from a supply well is derived from a nearby surface-water body. Water samples from the wells were tested for physical characteristics, nutrients, major and trace elements, and selected pesticides. Data for physical characteristics, nutrients, major and trace elements were published in Water-Data Report OH-99-2 (Shindel and others, 2000, Water Resources Data Ohio Water Year 1999 report, Volume 2. St. Lawrence River Basin and Statewide Project Data, p. 387-392). Water samples from the 15 public supply wells were also tested for 45 pesticides and 2 pesticide metabolites. However, these data were unavailable at the time 1999 report was published.

The table below lists general site data and the time and date the 15 wells were sampled. The table that follows lists the 47 pesticide compounds analyzed, the unit of measure (micrograms per liter, $\mu\text{g/L}$), the U.S. Geologocal Survey National Water Information System parameter code, and the method reporting level. The analytical method used detects selected pesticides and metabolites that are effeciently partitioned from a water sample by solid-phase extraction and are sufficiently volatile and thermally stable for analysis by gas chromatography. Each sample was analyzed for all of the compounds in this schedule; however, only detections are reported in the results table that appears on the page following the analytical schedule.

PESTICIDE DATA—ANALYTICAL SCHEDULE

Only pesticide compounds that were detected in one or more wells are listed in the water-quality table that follow the list of analytes given below.

[$\mu\text{g/L}$, micrograms per liter; (49260) USGS National Water Information System parameter code; <, concentration or value reported is less than that indicated]

| Acetochlor ($\mu\text{g/L}$) (49260) | Aalachlor ($\mu\text{g/L}$) (46342) | Atrazine ($\mu\text{g/L}$) (39632) | Deethylatrazine ($\mu\text{g/L}$) (04040) | Methylazinphos ($\mu\text{g/L}$) (82686) | Benfluralin ($\mu\text{g/L}$) (82673) |
|---|---|---|--|--|---|
| <0.002 | <0.002 | <0.001 | <0.002 | <0.001 | <0.002 |
| Butylate ($\mu\text{g/L}$) (04028) | Carbaryl ($\mu\text{g/L}$) (82680) | Carbofuran ($\mu\text{g/L}$) (82674) | Chlopyrifos ($\mu\text{g/L}$) (38933) | Cyanazine ($\mu\text{g/L}$) (04041) | DCPA ($\mu\text{g/L}$) (82682) |
| <0.002 | <0.003 | <0.003 | <0.004 | <0.004 | <0.002 |
| p,p'-DDE ($\mu\text{g/L}$) (34653) | Diazinon ($\mu\text{g/L}$) (39572) | Dieldrin ($\mu\text{g/L}$) (39381) | 2,6-Diethylaniline ($\mu\text{g/L}$) (82660) | Disulfoton ($\mu\text{g/L}$) (82677) | EPTC ($\mu\text{g/L}$) (82668) |
| 0.006 | <0.002 | <0.001 | <0.003 | <0.017 | <0.002 |
| Ethalfluralin ($\mu\text{g/L}$) (82663) | Ethoprop ($\mu\text{g/L}$) (82672) | Fonofos ($\mu\text{g/L}$) (04095) | Alpha BHC ($\mu\text{g/L}$) (34253) | Lindane ($\mu\text{g/L}$) (39341) | Linuron ($\mu\text{g/L}$) (82666) |
| <0.004 | <0.003 | <0.003 | <0.002 | <0.004 | <0.002 |
| Malathion ($\mu\text{g/L}$) (39532) | Meholachlor ($\mu\text{g/L}$) (39415) | Metribuzin ($\mu\text{g/L}$) (82630) | Molinate ($\mu\text{g/L}$) (82671) | Napropamide ($\mu\text{g/L}$) (82684) | Parathion ($\mu\text{g/L}$) (39542) |
| <0.005 | <0.002 | <0.004 | <0.004 | <0.003 | <0.004 |
| Methylparathion ($\mu\text{g/L}$) (82667) | Pebulate ($\mu\text{g/L}$) (82669) | Pendimethalin ($\mu\text{g/L}$) (82683) | Permethrin, cis ($\mu\text{g/L}$) (82687) | Phorate ($\mu\text{g/L}$) (82664) | Pronamide ($\mu\text{g/L}$) (82676) |
| <0.006 | <0.004 | <0.004 | <0.005 | <0.002 | <0.003 |
| Prometon ($\mu\text{g/L}$) (04037) | Propachlor ($\mu\text{g/L}$) (04024) | Propanil ($\mu\text{g/L}$) (82679) | Propargite ($\mu\text{g/L}$) (82685) | Simazine ($\mu\text{g/L}$) (04035) | Thiobencarb ($\mu\text{g/L}$) (82681) |
| <0.018 | <0.007 | <0.004 | <0.013 | <0.005 | <0.002 |
| Tebuthiuron ($\mu\text{g/L}$) (82670) | Terbacil ($\mu\text{g/L}$) (82665) | Terbufos ($\mu\text{g/L}$) (82675) | Triallate ($\mu\text{g/L}$) (82678) | Trifluralin ($\mu\text{g/L}$) (82661) | |
| <0.010 | <0.007 | <0.013 | <0.001 | <0.002 | |

PROJECT DATA
Water Data for Bolton Well Field

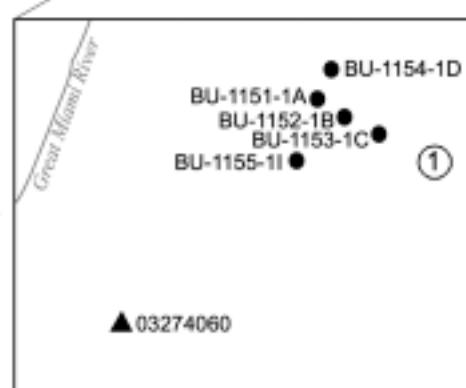

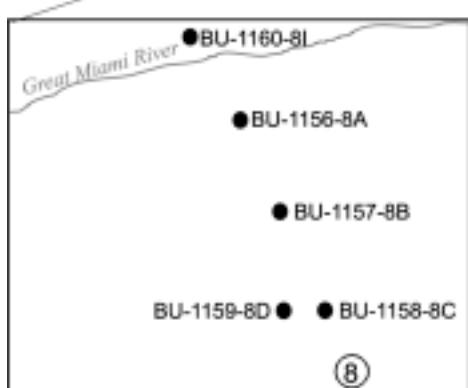

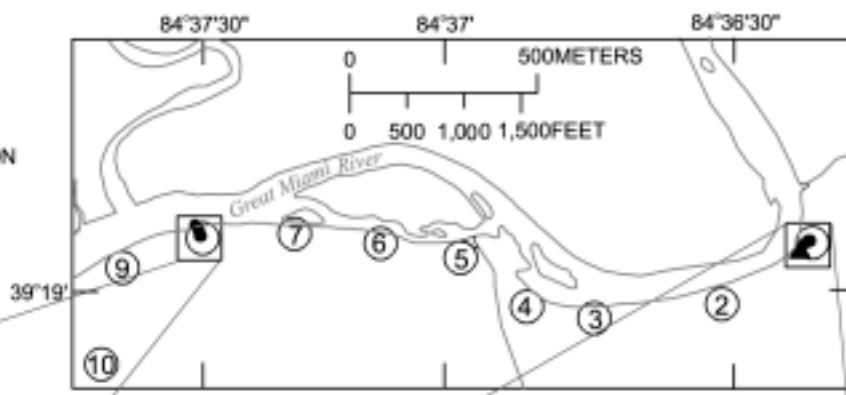

247

The tables on subsequent pages list maximum and minimum daily values of hourly data collected at wells and half-hour data collected at a surface-water station in southern Butler County, Ohio. The tables also include the results of chemical analysis of ground-water samples. These wells and station were established to assist in defining aquifer characteristics near the Cincinnati Water Works, Bolton Well Field, and the Great Miami River.

EXPLANATION

- ① PRODUCTION WELL LOCATION
- MONITORING WELLS

PROJECT DATA
Water Data for Bolton Well Field

391904084362101. LOCAL NUMBER, BU-1151-1A

LOCATION.—Latitude 39°19'04", longitude 84°36'21", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Observation well drilled by rotasonic techniques, diameter 4.0 in., depth 30 ft from land surface to bottom of screen.

INSTRUMENTATION.—YSI Model 6920 data sonde with turbidity probe set for 60-minute records. Sonde set at a depth of 27.6 ft below land surface.

DATUM.—Altitude of land surface is 546.87 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 2.18 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on July 21, 1999. Negative turbidity and dissolved oxygen values are due to the resolution of the data sonde and the close proximity of the actual value to zero.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: July 21, 1999 to current year.

SPECIFIC CONDUCTANCE: July 21, 1999 to current year.

pH: July 21, 1999 to current year.

WATER TEMPERATURE: July 21, 1999 to current year.

TURBIDITY: July 21, 1999 to current year.

DISSOLVED OXYGEN: July 21, 1999 to current year.

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 525.27 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.22 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,170 microsiemens per centimeter, Sept. 28 and 29, 1999; Minimum, 524 microsiemens per centimeter, Apr. 11, 2000.

pH: Maximum, 7.5, several days during period of record; Minimum, 7.1, July 22 to July 28, 1999.

WATER TEMPERATURE: Maximum, 28.7°C, Aug. 10, 11 and 12, 1999; Minimum, 4.8°C, Feb. 23, 2000.

TURBIDITY: Maximum, 4.0 NTU, July 31, 2000; Minimum, -1.0 NTU, several days during period of record.

DISSOLVED OXYGEN: Maximum, 3.4 milligrams per liter, Feb. 16 and 17, 2000; Minimum, -0.2 milligram per liter, Aug. 24 and 25, 2000.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 525.27 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.22 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,150 microsiemens per centimeter, Oct. 1-3, 1999; Minimum, 524 microsiemens per centimeter, Apr. 11, 2000.

pH: Maximum, 7.5, several days during period of record; Minimum, 7.2, several days during period of record.

WATER TEMPERATURE: Maximum, 26.4°C, Sept. 11, 2000; Minimum, 4.8°C, Feb. 23, 2000.

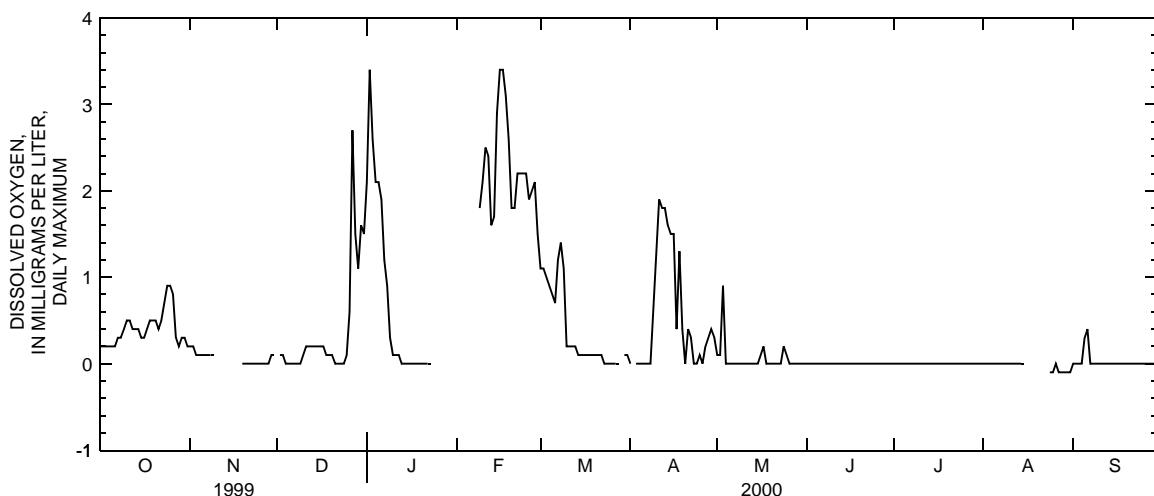

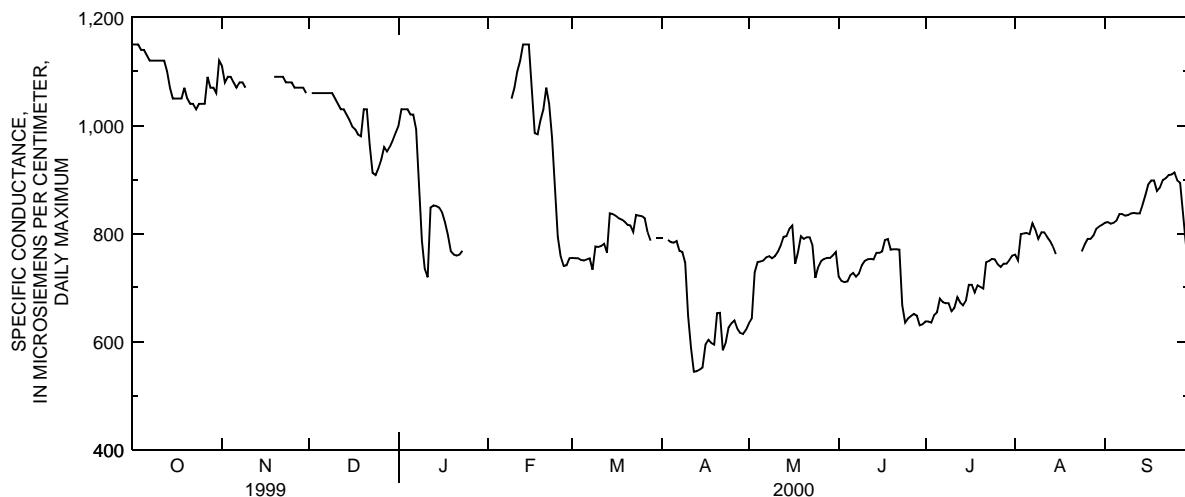

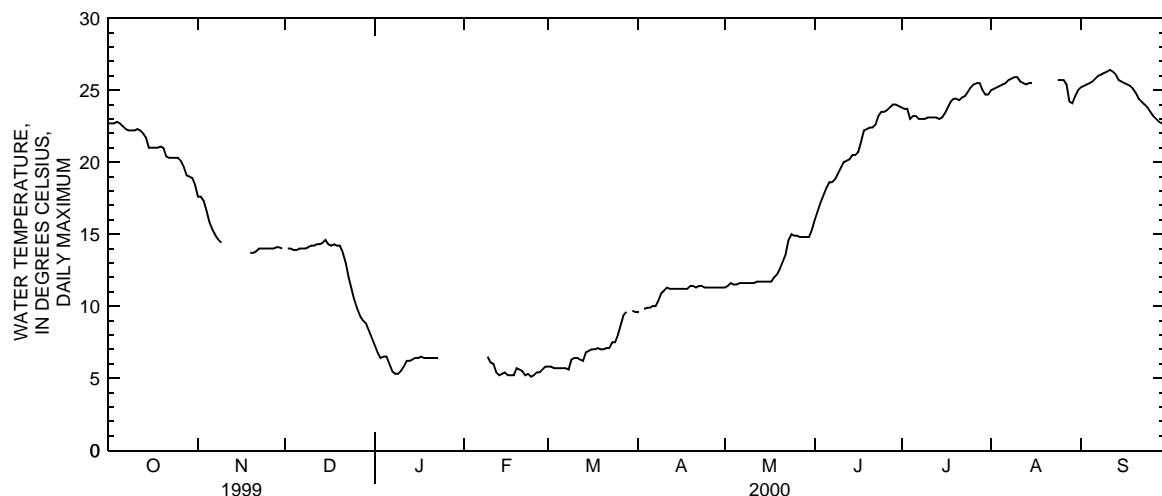

TURBIDITY: Maximum, 4.0 NTU, July 31, 2000; Minimum, -1.0 NTU, several days during period of record.

DISSOLVED OXYGEN: Maximum, 3.4 milligrams per liter, Feb. 16 and 17, 2000; Minimum, -0.2 milligram per liter, Aug. 24 and 25, 2000.

PROJECT DATA
Water Data for Bolton Well Field

391904084362102. LOCAL NUMBER, BU-1152-1B

LOCATION.—Latitude 39°19'04", longitude 84°36'21", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Observation well drilled by rotasonic techniques, diameter 4.0 in., depth 45 ft from land surface to bottom of screen.

INSTRUMENTATION.—YSI Model 6920 data sonde set for 60-minute records. Sonde set at a depth of 42.7 ft below land surface.

DATUM.—Altitude of land surface is 547.58 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 1.97 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on July 22, 1999. Negative dissolved oxygen values are due to the resolution of the data sonde. This is a non-vented sonde; water level data are not corrected for barometric pressure.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: July 22, 1999 to current year.

SPECIFIC CONDUCTANCE: July 22, 1999 to current year.

pH: July 22, 1999 to current year.

WATER TEMPERATURE: July 22, 1999 to current year.

DISSOLVED OXYGEN: July 22, 1999 to current year.

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 524.40 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.84 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,160 microsiemens per centimeter, Oct. 4, 1999; Minimum, 583 microsiemens per centimeter, Apr. 24, 2000.

pH: Maximum, 7.6, Oct. 5, 1999; Minimum, 6.6, Nov. 15 and 16, 1999.

WATER TEMPERATURE: Maximum, 29.8°C, Aug. 6 and 7, 1999; Minimum, 5.5°C, Jan. 6 and 7, 2000.

DISSOLVED OXYGEN: Maximum, 2.7 milligrams per liter, Feb. 24, 2000; Minimum -0.7 milligram per liter, Aug. 4, 1999.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 524.40 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.84 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,160 microsiemens per centimeter, Oct. 4, 1999; Minimum, 583 microsiemens per centimeter, Apr. 24, 2000.

pH: Maximum, 7.6, Oct. 5, 1999; Minimum, 6.6, Nov. 15 and 16, 1999.

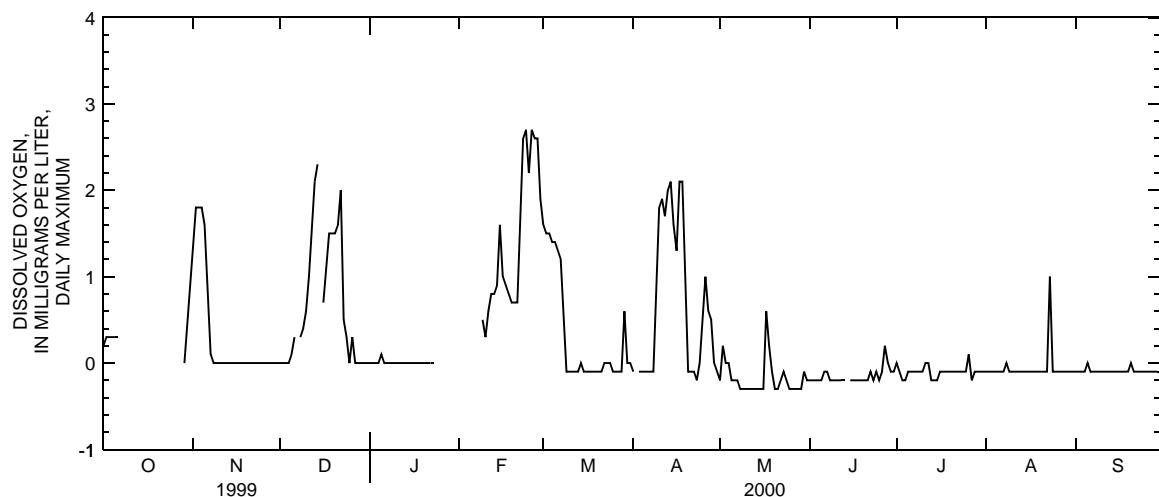

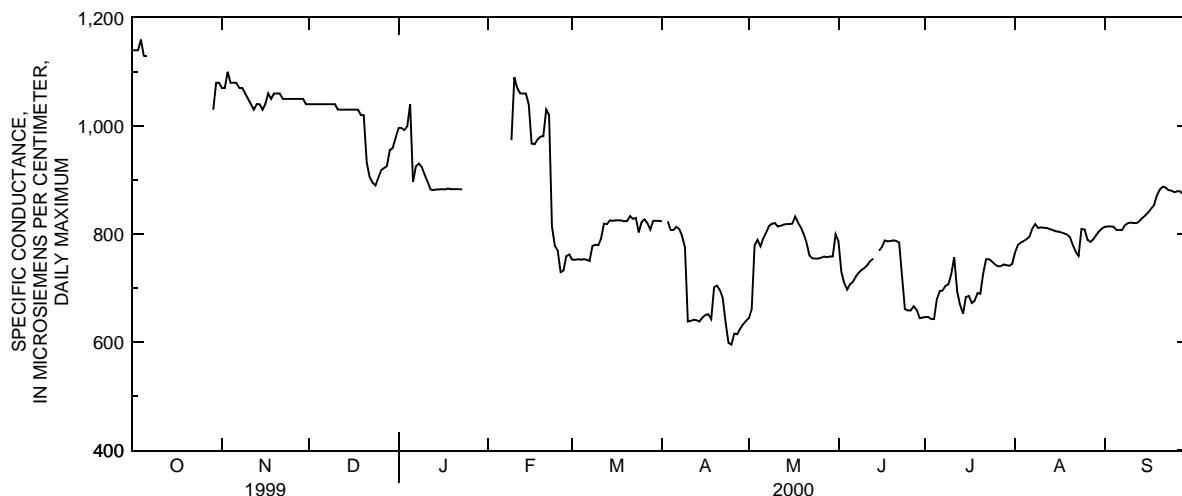

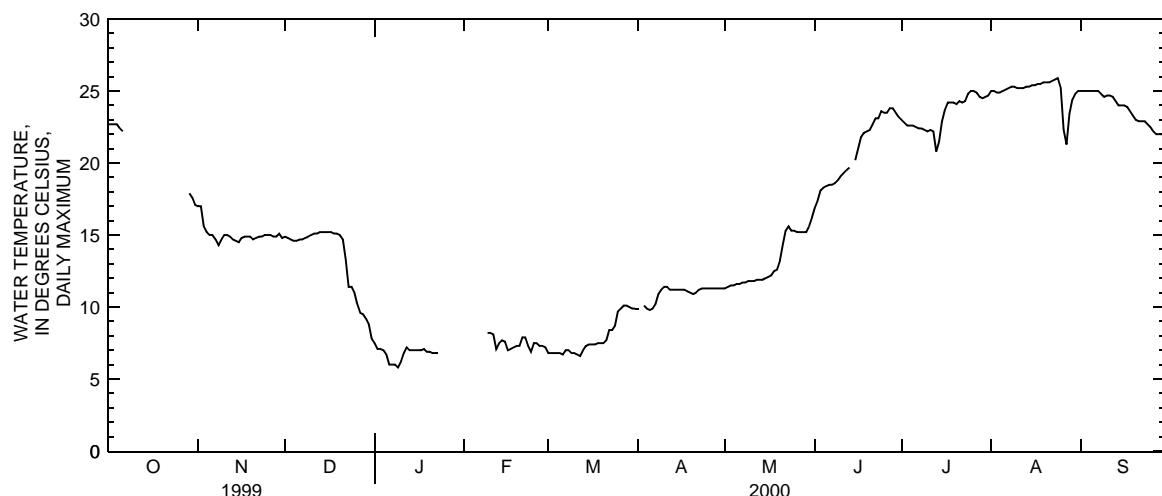

WATER TEMPERATURE: Maximum, 25.9°C, Aug. 24, 2000; Minimum, 5.5°C, Jan. 6 and 7, 2000.

DISSOLVED OXYGEN: Maximum, 2.7 milligrams per liter, Feb. 24, 2000; Minimum -0.3 milligram per liter, May 6-30, 2000.

PROJECT DATA
Water Data for Bolton Well Field

267

391904084362103. LOCAL NUMBER, BU-1153-1C

LOCATION.—Latitude 39°19'04", longitude 84°36'21", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Observation well drilled by rotasonic techniques, diameter 4.0 in., depth 57 ft from land surface to bottom of screen.

INSTRUMENTATION.—YSI Model 6920 data sonde set for 60-minute records. Sonde set at a depth of 54.6 ft below land surface.

DATUM.—Altitude of land surface is 547.60 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 2.07 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on July 22, 1999. This is a non-vented sonde, water level data is not corrected for barometric pressure.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: July 22, 1999 to current year

SPECIFIC CONDUCTANCE: July 22, 1999 to current year

pH: July 22, 1999 to current year

WATER TEMPERATURE: July 22, 1999 to current year

DISSOLVED OXYGEN: July 22, 1999 to current year

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 523.01 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.80 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,160 microsiemens per centimeter, Oct. 4 and 5, 1999; Minimum, 584 microsiemens per centimeter, Apr. 25 and 26, 2000.

pH: Maximum, 7.6, several days during period of record; Minimum, 7.0, July 26 to 31, 1999.

WATER TEMPERATURE: Maximum, 30.1°C, Aug. 8 and 9, 1999; Minimum, 5.6°C, Jan. 10, 2000.

DISSOLVED OXYGEN: Maximum, 2.6 milligrams per liter, Feb. 29, 2000; Minimum 0.0 milligram per liter, several days during period of record.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 523.01 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.80 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,160 microsiemens per centimeter, Oct. 4 and 5, 1999; Minimum, 584 microsiemens per centimeter, Apr. 25 and 26, 2000.

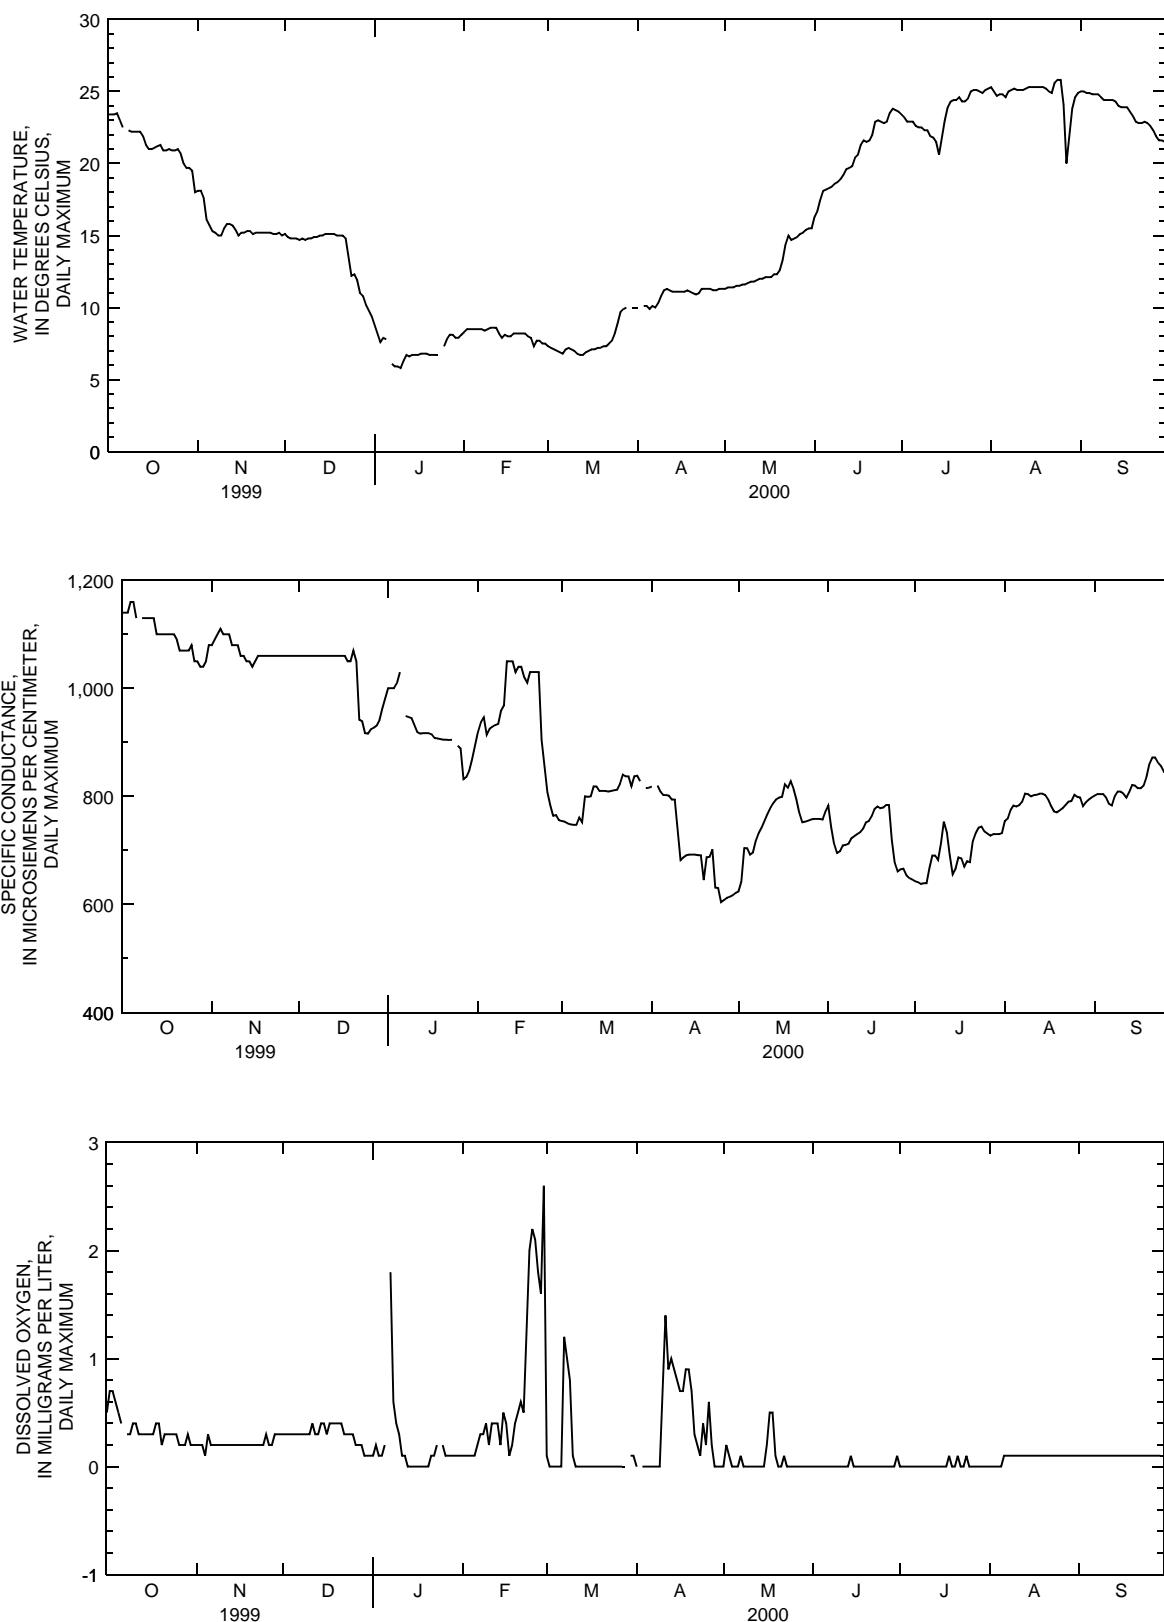

pH: Maximum, 7.6, several days during period of record; Minimum, 7.2, several days during period of record.

WATER TEMPERATURE: Maximum, 25.8°C, Aug. 24 and 25, 2000; Minimum, 5.6°C, Jan. 10, 2000.

DISSOLVED OXYGEN: Maximum, 2.6 milligrams per liter, Feb. 29, 2000; Minimum 0.0 milligram per liter, several days during period of record.

PROJECT DATA
Water Data for Bolton Well Field

391904084362104. LOCAL NUMBER, BU-1154-1D

LOCATION.—Latitude 39°19'04", longitude 84°36'21", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Observation well drilled by rotasonic techniques, diameter 4.0 in., depth 87 ft from land surface to bottom of screen.

INSTRUMENTATION.—YSI Model 6920 data sonde set for 60-minute records. Sonde set at a depth of 85.0 ft below land surface.

DATUM.—Altitude of land surface is 547.70 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 2.38 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on July 27, 1999. Negative dissolved oxygen values are due to the resolution of the data sonde. This is a non-vented sonde; water level data are not corrected for barometric pressure.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: July 27, 1999 to current year

SPECIFIC CONDUCTANCE: July 27, 1999 to current year

pH: July 27, 1999 to current year

WATER TEMPERATURE: July 27, 1999 to current year

DISSOLVED OXYGEN: July 27, 1999 to current year

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 505.18 ft above NAVD of 1988, Feb. 1, 2000; Maximum daily high, 537.82 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 785 microsiemens per centimeter, Dec. 20, 1999; Minimum, 712 microsiemens per centimeter, Aug. 20, 2000.

pH: Maximum, 7.3, Aug. 12 to 18, 1999 and Jan. 7-18, 2000; Minimum, 6.8, Feb. 21, 2000.

WATER TEMPERATURE: Maximum, 14.6°C, July 14, 2000; Minimum, 9.9°C, Feb. 1, 2000.

DISSOLVED OXYGEN: Maximum, 1.3 milligrams per liter, Feb. 21, 2000; Minimum -0.1 milligram per liter, Aug. 19, Sept. 9, 10 and 11, 1999 and Feb. 20, 2000.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 505.18 ft above NAVD of 1988, Feb. 1, 2000; Maximum daily high, 537.82 ft above NAVD of 1988, Apr. 12, 2000.

SPECIFIC CONDUCTANCE: Maximum, 785 microsiemens per centimeter, Dec. 20, 1999; Minimum, 712 microsiemens per centimeter, Aug. 20, 2000.

pH: Maximum, 7.3, Jan. 7 to 18, 2000; Minimum, 6.8, Feb. 21, 2000.

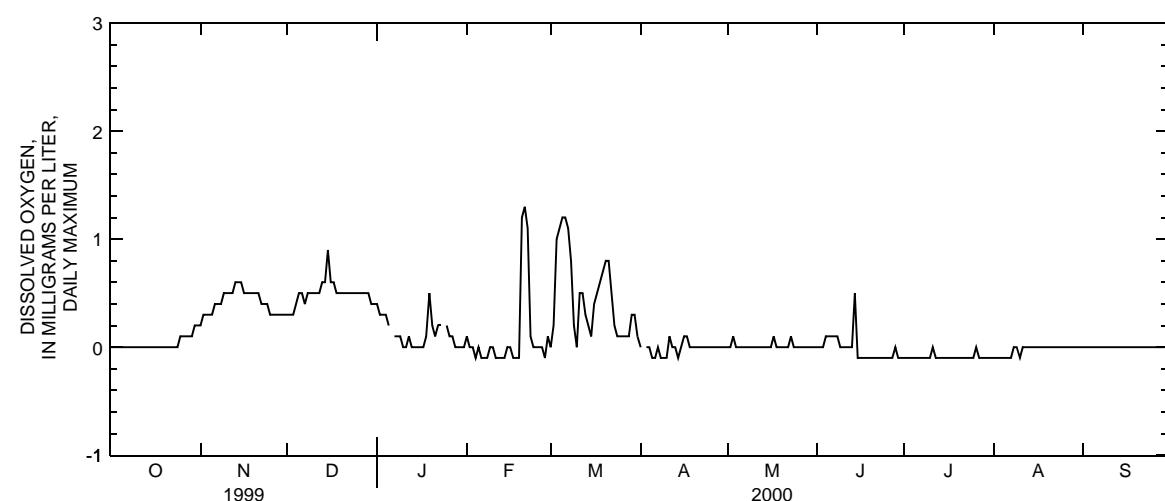

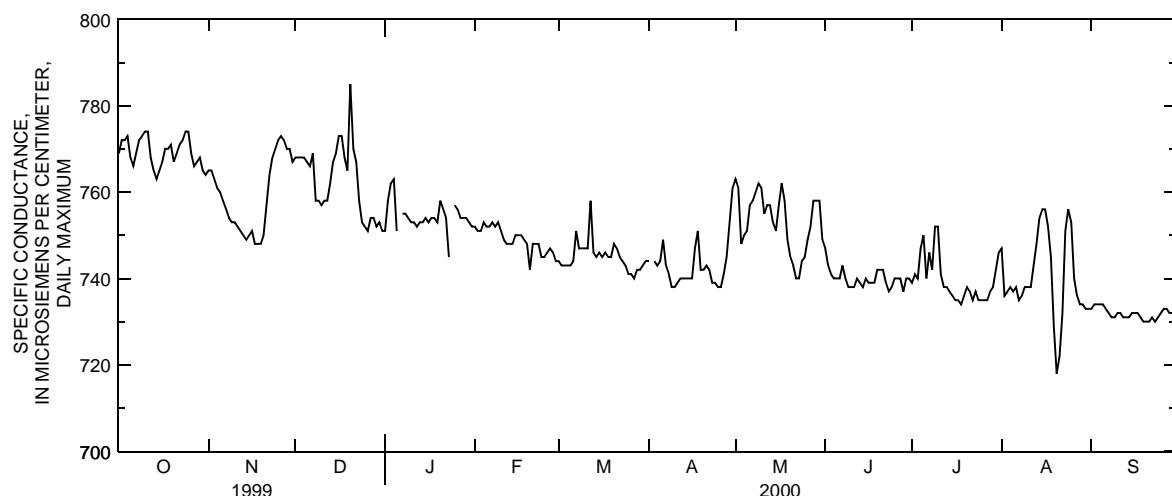

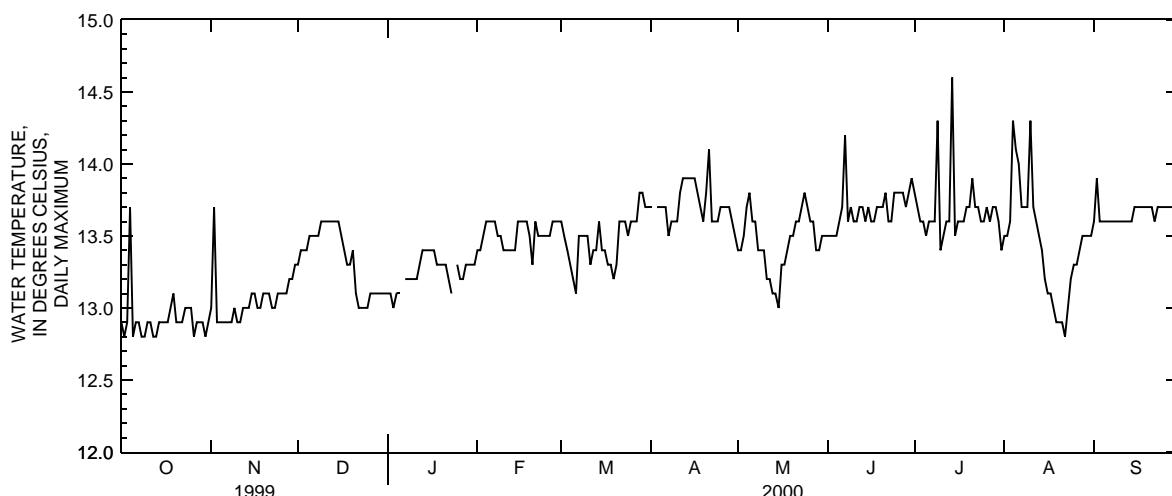

WATER TEMPERATURE: Maximum, 14.6°C, July 14, 2000; Minimum, 9.9°C, Feb. 1, 2000.

DISSOLVED OXYGEN: Maximum, 1.3 milligrams per liter, Feb. 21, 2000; Minimum -0.1 milligram per liter, Feb. 20, 2000.

PROJECT DATA
Water Data for Bolton Well Field

285

391904084362105. LOCAL NUMBER, BU-1155-11

LOCATION.—Latitude 39°19'04", longitude 84°36'21", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Inclined observation well drilled at 30 degree angle from horizontal by rotasonic techniques, diameter 4.0 in., depth 57 ft from top of casing to bottom of screen.

INSTRUMENTATION.—YSI Model 6600 data sonde with turbidity probe set for 60-minute records. Sonde set at an altitude of 521.86 feet above North American Vertical Datum of 1988 (NAVD of 1988). Elevation estimated from angle of well (inclinometer) and length to transducer.

DATUM.—Altitude of land surface is 547.37 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 2.63 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on Oct. 7, 1999. Negative turbidity and dissolved oxygen values are due to the resolution of the data sonde and the close proximity of the actual value to zero.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: October 7, 1999 to current year.

SPECIFIC CONDUCTANCE: October 7, 1999 to current year.

pH: October 7, 1999 to current year.

WATER TEMPERATURE: October 7, 1999 to current year.

TURBIDITY: October 7, 1999 to current year.

DISSOLVED OXYGEN: October 7, 1999 to current year.

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 526.78 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.53 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1270 microsiemens per centimeter, Feb. 11 and 12, 2000; Minimum, 412 microsiemens per centimeter, Apr. 10, 2000.

pH: Maximum, 8.0, Oct. 20, 26, and Nov. 3, 1999; Minimum, 5.4, Mar. 5, 2000.

WATER TEMPERATURE: Maximum, 28.8°C, Sept. 5, 2000; Minimum, 2.0°C, Feb. 1, 2000.

TURBIDITY: Maximum, 11.0 NTU, Jan. 4, 2000; Minimum, -1.4 NTU, June 17, 2000.

DISSOLVED OXYGEN: Maximum, 9.4 milligrams per liter, Dec. 30, 1999; Minimum, -3.0 milligrams per liter, Nov. 9, 1999.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 526.78 ft above NAVD of 1988, Jan. 1 and 2, 2000; Maximum daily high, 537.53 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1270 microsiemens per centimeter, Feb. 11 and 12, 2000; Minimum, 412 microsiemens per centimeter, Apr. 10, 2000.

pH: Maximum, 8.0, Oct. 20, 26, and Nov. 3, 1999; Minimum, 5.4, Mar. 5, 2000.

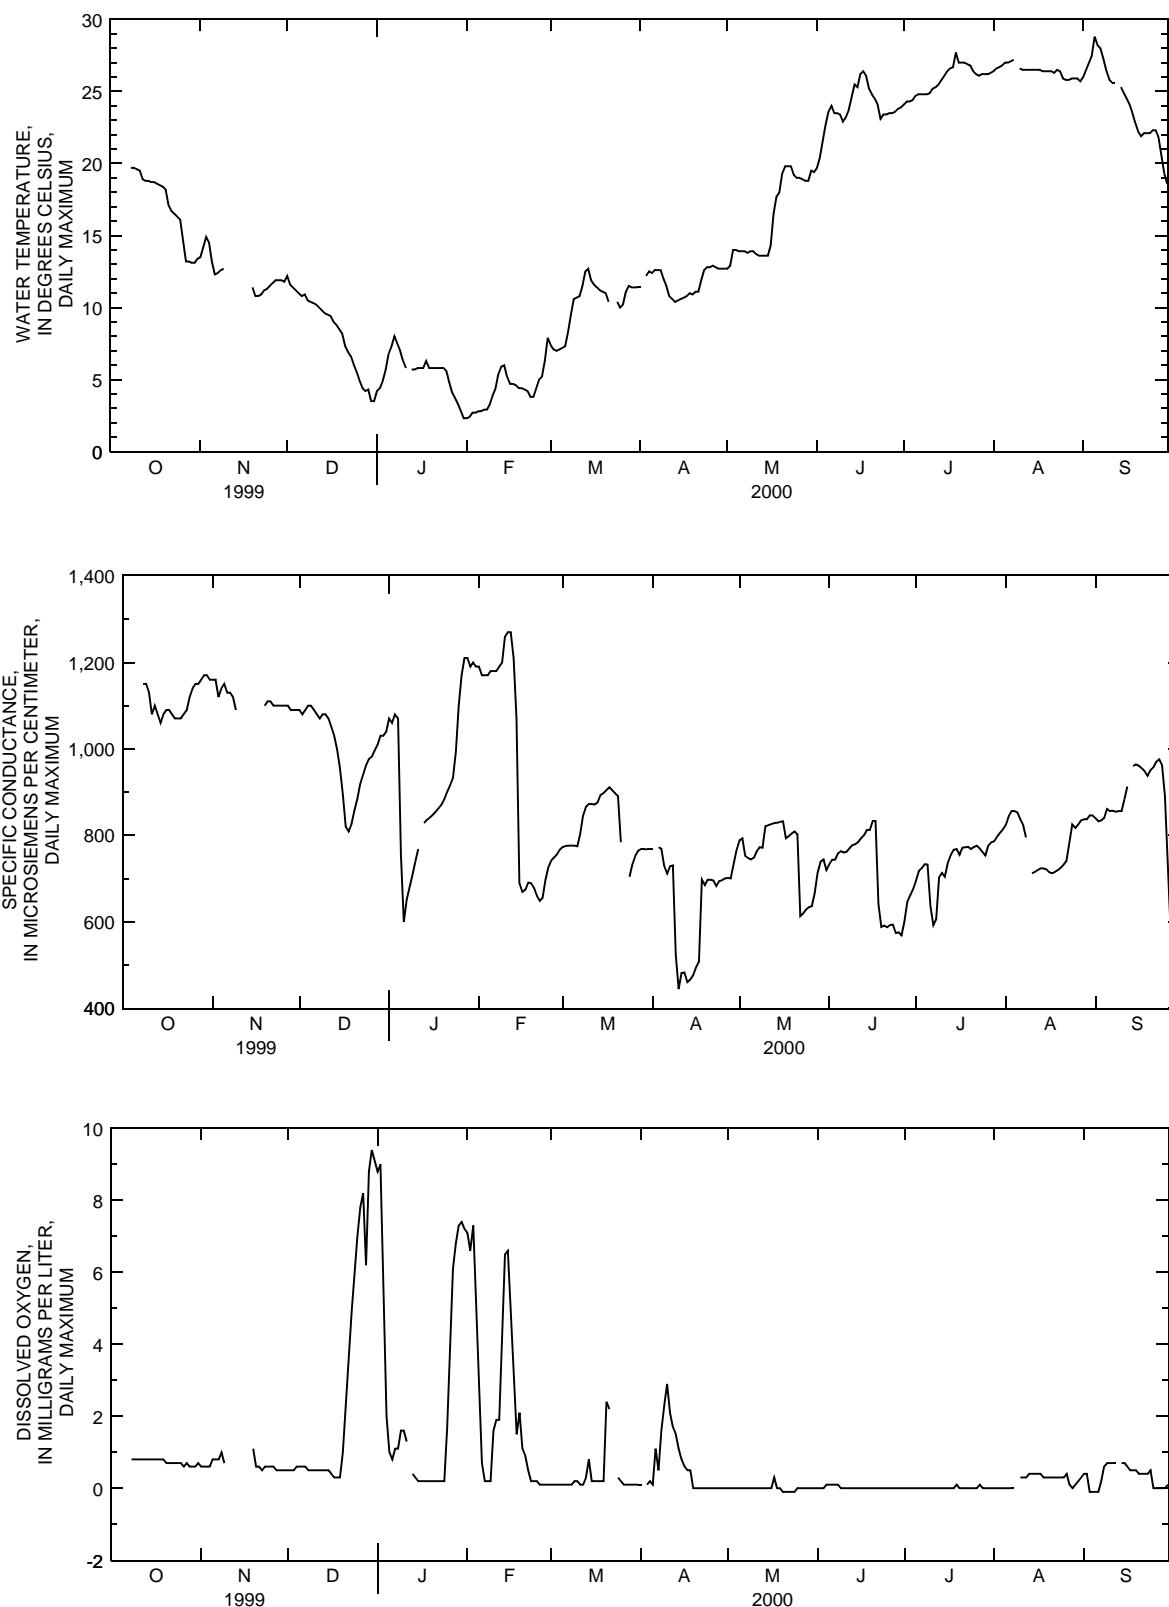

WATER TEMPERATURE: Maximum, 28.8°C, Sept. 5, 2000; Minimum, 2.0°C, Feb. 1, 2000.

TURBIDITY: Maximum, 11.0 NTU, Jan. 4, 2000; Minimum, -1.4 NTU, June 17, 2000.

DISSOLVED OXYGEN: Maximum, 9.4 milligrams per liter, Dec. 30, 1999; Minimum, -3.0 milligrams per liter, Nov. 9, 1999.

PROJECT DATA
Water Data for Bolton Well Field

391905084372901. LOCAL NUMBER, BU-1156-8A

LOCATION.—Latitude 39°19'05", longitude 84°37'29", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Observation well drilled by rotasonic techniques, diameter 4.0 in., depth 40 ft from land surface to bottom of screen.

INSTRUMENTATION.—YSI Model 6920 data sonde with turbidity probe set for 60-minute records. Sonde set at a depth of 38.4 ft below land surface.

DATUM.—Altitude of land surface is 541.18 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 4.42 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on July 28, 1999. Negative turbidity and dissolved oxygen values are due to the resolution of the data sonde and the close proximity of the actual value to zero. Rotasonic drilling of a well in close proximity to this well began on Sept. 7, 1999. This is a non-vented sonde; water level data are not corrected for barometric pressure.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: July 28, 1999 to current year

SPECIFIC CONDUCTANCE: July 28, 1999 to current year

pH: July 28, 1999 to current year

WATER TEMPERATURE: July 28, 1999 to current year

TURBIDITY: July 28, 1999 to current year

DISSOLVED OXYGEN: July 28, 1999 to current year

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 514.39 ft above NAVD of 1988, Feb. 2, 2000; Maximum daily high, 538.00 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,220 microsiemens per centimeter, Feb. 29, 2000; Minimum, 602 microsiemens per centimeter, July 25, 2000.

pH: Maximum, 7.7, Apr. 16-23, 2000; Minimum, 6.7, Sept. 11, 12, 13, and 14, 1999.

WATER TEMPERATURE: Maximum, 30.2°C, Aug. 26, 29, 30 and 31, 1999; Minimum, 4.1°C, Mar. 14 and 16, 2000.

TURBIDITY: Maximum, 10 NTU, Sept. 13, 1999; Minimum, -3.0 NTU, Oct. 1, 1999.

DISSOLVED OXYGEN: Maximum, 3.7 milligrams per liter, Sept. 14, 1999; Minimum -1.0 milligram per liter, June 28, 2000.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 514.39 ft above NAVD of 1988, Feb. 2, 2000; Maximum daily high, 538.00 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,220 microsiemens per centimeter, Feb. 29, 2000; Minimum, 602 microsiemens per centimeter, July 25, 2000.

pH: Maximum, 7.7, Apr. 16-23, 2000; Minimum, 7.3 Oct. 2-4, 1999.

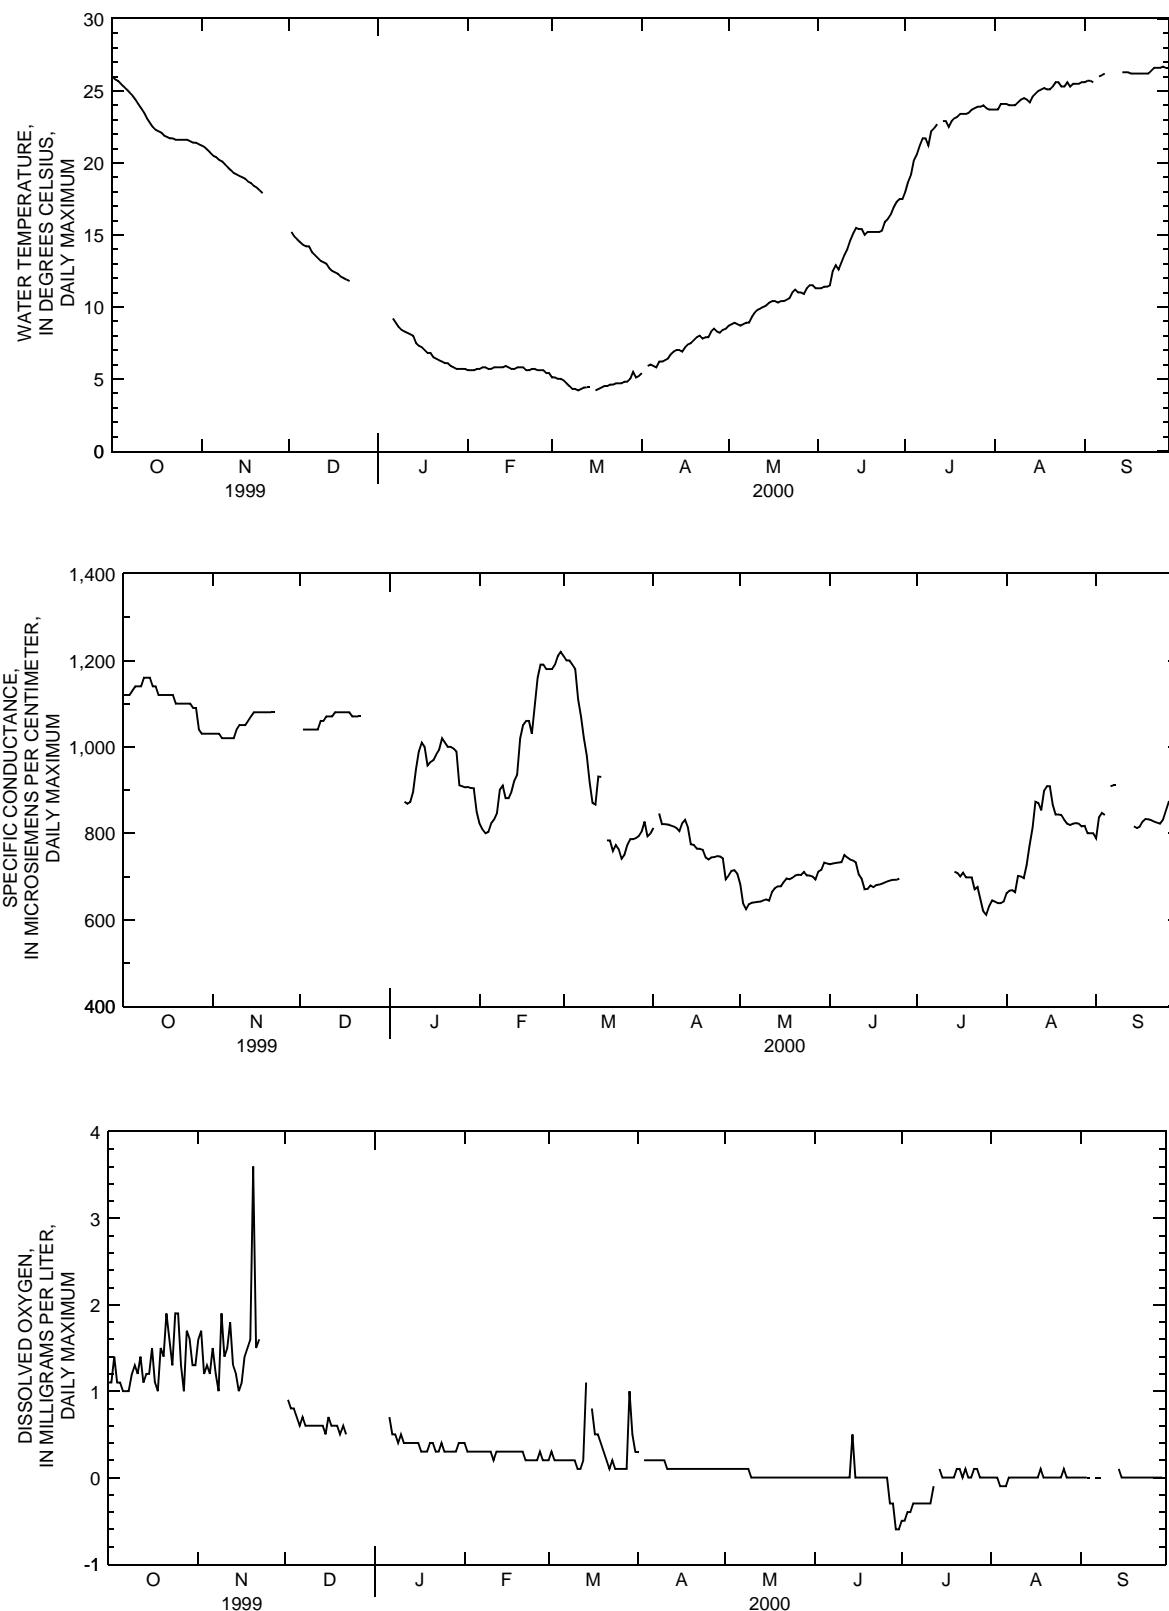

WATER TEMPERATURE: Maximum, 26.7°C, Sept. 28, 2000; Minimum, 4.1°C, Mar. 14 and 16, 2000.

TURBIDITY: Maximum, 1.0 NTU, several days during period of record; Minimum, -3.0 NTU, Oct. 1, 1999.

DISSOLVED OXYGEN: Maximum, 3.6 milligrams per liter, Nov. 20, 1999; Minimum -1.0 milligram per liter, June 28, 2000.

PROJECT DATA
Water Data for Bolton Well Field

391905084372903. LOCAL NUMBER, BU-1158-8C

LOCATION.—Latitude 39°19'05", longitude 84°37'29", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Observation well drilled by rotasonic techniques, diameter 4.0 in., depth 96 ft from land surface to bottom of screen.

INSTRUMENTATION.—YSI Model 6920 data sonde set for 60-minute records. Sonde set at a depth of 93.9 ft below land surface.

DATUM.—Altitude of land surface is 545.46 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 2.24 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on July 27, 1999. Negative dissolved oxygen values are due to the resolution of the data sonde and the close proximity of the actual value to zero. This is a non-vented sonde; water level data are not corrected for barometric pressure.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: July 27, 1999 to current year

SPECIFIC CONDUCTANCE: July 27, 1999 to current year

pH: July 27, 1999 to current year

WATER TEMPERATURE: July 27, 1999 to current year

DISSOLVED OXYGEN: July 27, 1999 to current year

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 518.33 ft above NAVD of 1988, Dec. 12, 1999; Maximum daily high, 538.01 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1130 microsiemens per centimeter, Nov. 3, 1999; Minimum, 609 microsiemens per centimeter, Aug. 29, 2000.

pH: Maximum, 7.6, July 29, 1999; Minimum, 7.2, several days during period of record.

WATER TEMPERATURE: Maximum, 24.8°C, Oct. 14, 1999; Minimum, 10.8°C, June 29, 2000.

DISSOLVED OXYGEN: Maximum, 1.1 milligrams per liter, Jan. 1 and 2, 2000; Minimum, -0.7 milligram per liter, Dec. 23, 1999.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 518.33 ft above NAVD of 1988, Dec. 12, 1999; Maximum daily high, 538.01 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1130 microsiemens per centimeter, Nov. 3, 1999; Minimum, 609 microsiemens per centimeter, Aug. 29, 2000.

pH: Maximum, 7.5, several days during period of record; Minimum, 7.2, several days during period of record.

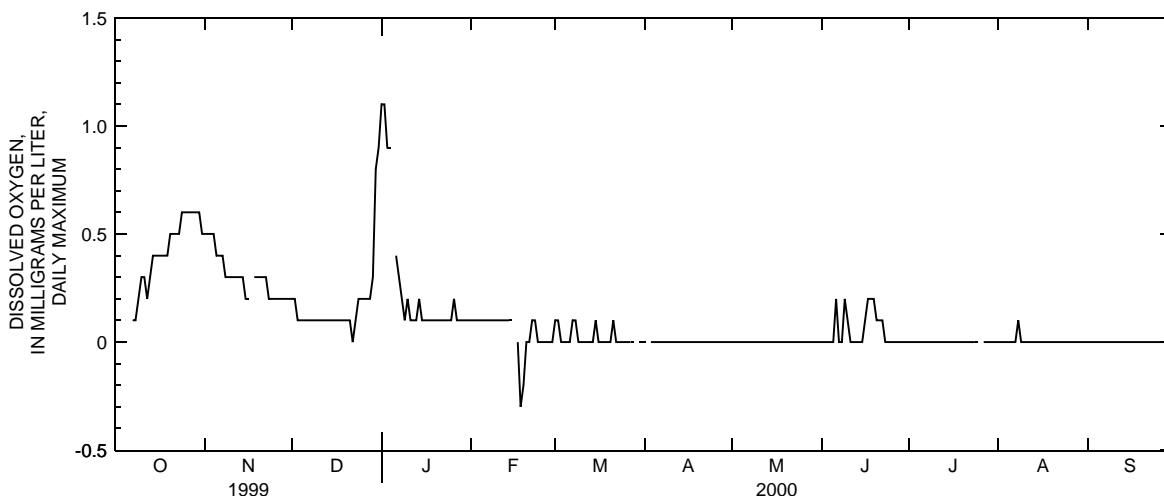

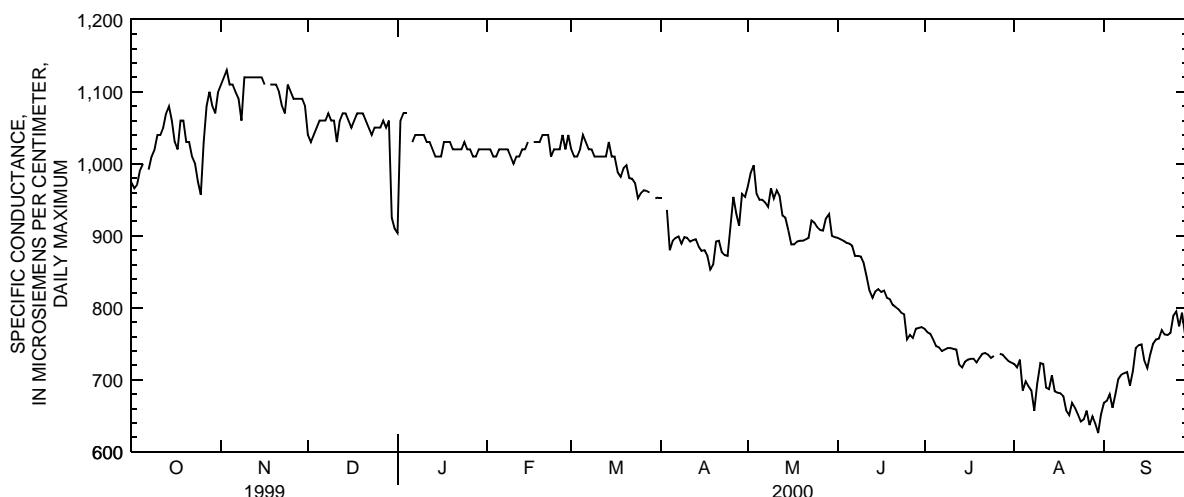

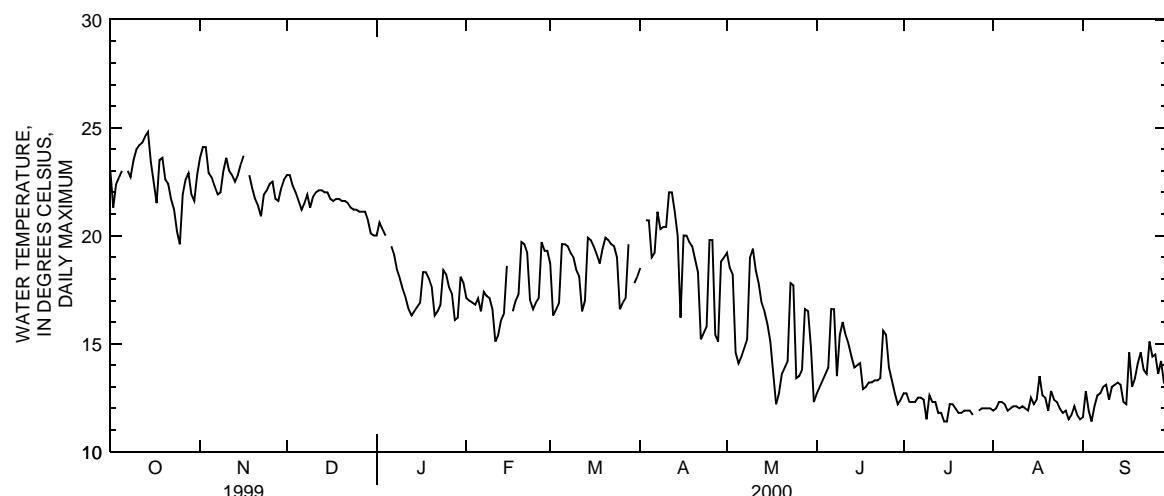

WATER TEMPERATURE: Maximum, 24.8°C, Oct. 14, 1999; Minimum, 10.8°C, June 29, 2000.

DISSOLVED OXYGEN: Maximum, 1.1 milligrams per liter, Jan. 1 and 2, 2000; Minimum, -0.7 milligram per liter, Dec. 23, 1999.

PROJECT DATA
Water Data for Bolton Well Field

391905084372904. LOCAL NUMBER, BU-1159-8D

LOCATION.—Latitude 39°19'05", longitude 84°37'29", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Observation well drilled by rotasonic techniques, diameter 4.0 in., depth 185 ft from land surface to bottom of screen.

INSTRUMENTATION.—SI Model 6920 data sonde set for 60-minute records. Sonde set at a depth of 183.5 ft below land surface.

DATUM.—Altitude of land surface is 545.75 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 2.20 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on July 28, 1999. Negative dissolved oxygen values are due to the resolution of the data sonde and the close proximity of the actual value to zero. This is a non-vented sonde; water level data are not corrected for barometric pressure.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: July 28, 1999 to current year

SPECIFIC CONDUCTANCE: July 28, 1999 to current year

pH: July 28, 1999 to current year

WATER TEMPERATURE: July 28, 1999 to current year

DISSOLVED OXYGEN: July 28, 1999 to current year

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 515.24 ft above NAVD of 1988, Dec. 12, 1999; Maximum daily high, 537.90 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 646 microsiemens per centimeter, Jan. 1 and 12, 2000; Minimum, 601 microsiemens per centimeter, July 31, 1999.

pH: Maximum, 7.5, July 29-Aug. 9, Nov. 11, and 16, 1999; Minimum, 7.3, several days during period of record.

WATER TEMPERATURE: Maximum, 12.6°C, several days during period of record; Minimum, 12.3°C, Jan. 5, 2000.

DISSOLVED OXYGEN: Maximum, 1.8 milligrams per liter, Aug. 21, 1999; Minimum -0.2 milligram per liter, several days during period of record.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 515.24 ft above NAVD of 1988, Dec. 12, 1999; Maximum daily high, 537.90 ft above NAVD of 1988, Apr. 9, 2000.

SPECIFIC CONDUCTANCE: Maximum, 646 microsiemens per centimeter, Jan. 1 and 12, 2000; Minimum, 602 microsiemens per centimeter, Mar. 21, 2000.

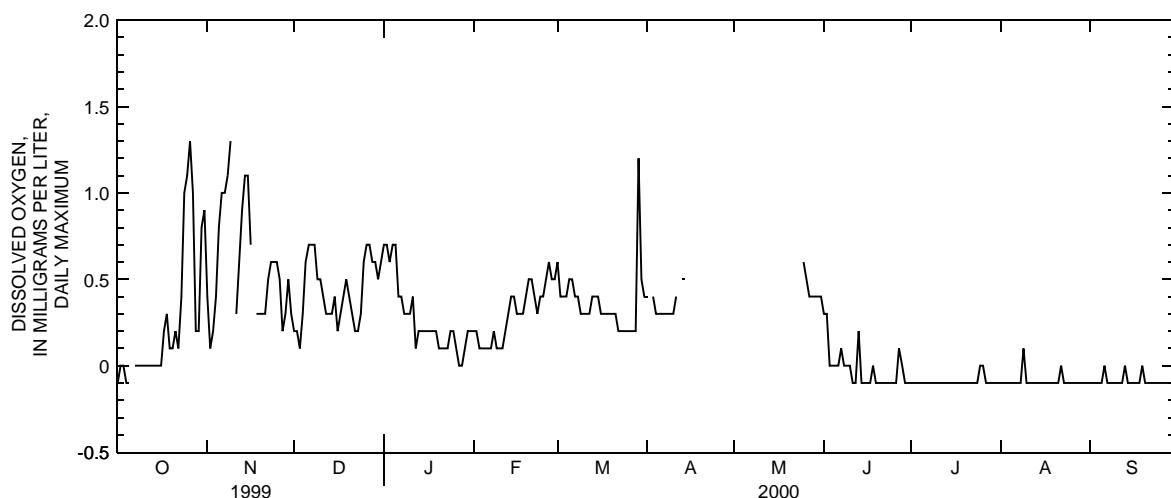

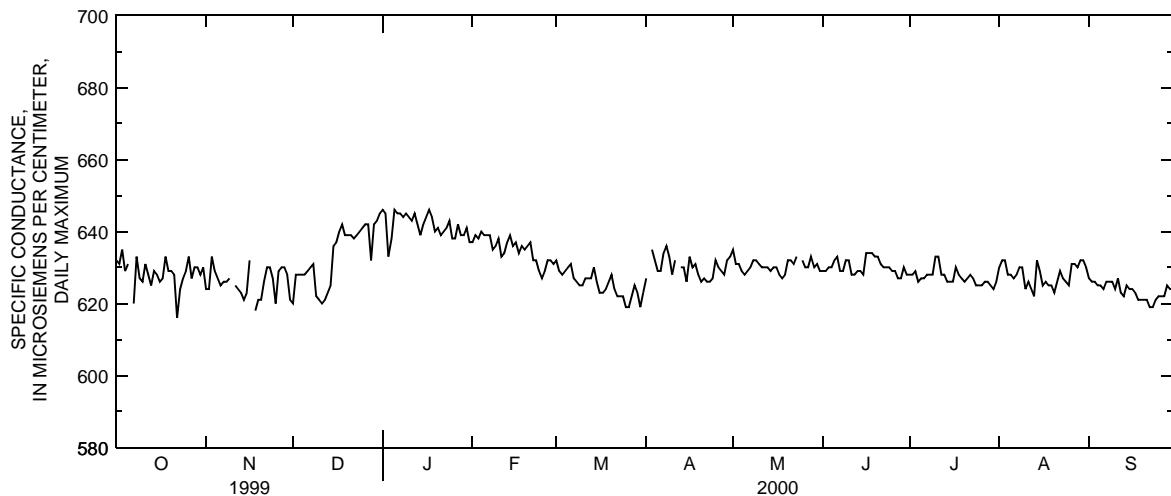

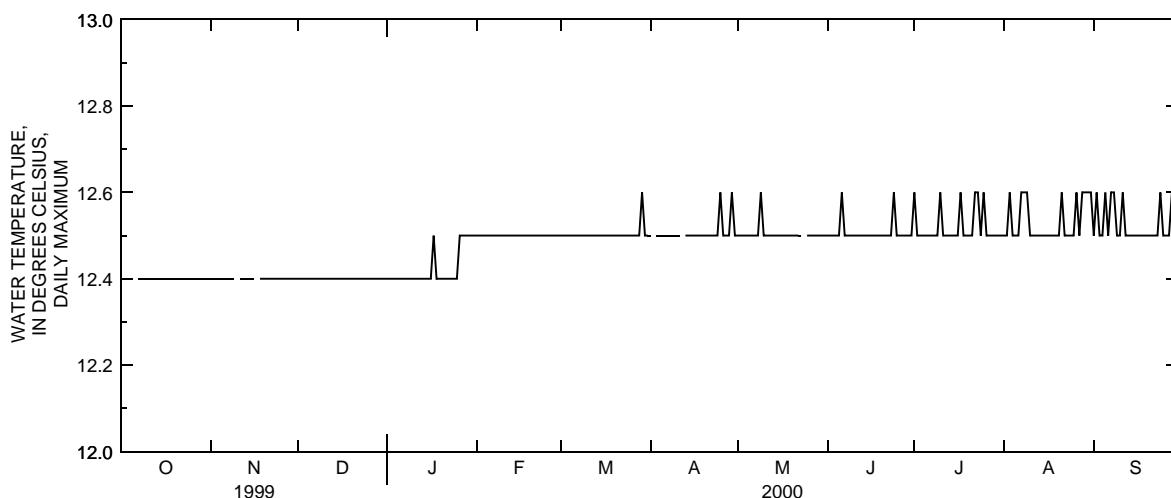

pH: Maximum, 7.5, Nov. 11 and 16, 1999; Minimum, 7.3, several days during period of record.

WATER TEMPERATURE: Maximum, 12.6°C, several days during period of record; Minimum, 12.3°C, Jan. 5, 2000.

DISSOLVED OXYGEN: Maximum, 1.3 milligrams per liter, Oct. 26, 1999 and Nov. 9, 1999; Minimum -0.2 milligram per liter, several days during period of record.

PROJECT DATA
Water Data for Bolton Well Field

391905084372905. LOCAL NUMBER, BU-1160-8I

LOCATION.—Latitude 39°19'05", longitude 84°37'29", Butler County, Hydrologic Unit 05080002.

AQUIFER.—Glacial outwash, sand and gravel; 112OTSH.

WELL CHARACTERISTICS.—Inclined observation well drilled at 20 degree angle from horizontal by rotasonic techniques, diameter 4.0 in., depth 55 ft from land surface to bottom of screen.

INSTRUMENTATION.—YSI Model 6920 data sonde with turbidity probe set for 60-minute records. Sonde set at an altitude of 515.80 feet above North American Vertical Datum of 1988 (NAVD of 1988). Elevation estimated from angle of well (inclinometer) and length to transducer.

DATUM.—Altitude of land surface is 532.88 ft above North American Vertical Datum of 1988 (NAVD of 1988). Measuring point is top of inner casing, 3.05 ft above land-surface datum.

REMARK.—This station is part of a network of wells designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on Nov. 4, 1999. Negative turbidity and dissolved oxygen values are due to the resolution of the data sonde and the close proximity of the actual value to zero.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: November 4, 1999 to current year.

SPECIFIC CONDUCTANCE: November 4, 1999 to current year.

pH: November 4, 1999 to current year.

WATER TEMPERATURE: November 4, 1999 to current year.

TURBIDITY: November 4, 1999 to current year.

DISSOLVED OXYGEN: November 4, 1999 to current year.

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Maximum daily low, 517.98 ft above NAVD of 1988, Sept. 19, 2000; Maximum daily high, 537.13 ft above NAVD of 1988, Apr. 8, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1200 microsiemens per centimeter, Feb. 6 and 7, 2000; Minimum, 380 microsiemens per centimeter, Feb. 18, 2000.

pH: Maximum, 8.2, Dec. 19-22, 1999, Jan. 3, and 4, 2000; Minimum, 6.7, Mar. 21, 2000.

WATER TEMPERATURE: Maximum, 27.2°C, Sept. 8, 2000; Minimum, 3.2°C, Feb. 8, 2000.

TURBIDITY: Maximum, 1200 NTU, Jan. 3, 4, Feb. 8, and Apr. 12, 2000; Minimum, -3.7 NTU, Aug. 6-8, 2000.

DISSOLVED OXYGEN: Maximum, 12.6 milligrams per liter, Feb. 18 and 19, 2000; Minimum, -0.8 milligram per liter, Aug. 11 and 12, 2000.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Maximum daily low, 517.98 ft above NAVD of 1988, Sept. 19, 2000; Maximum daily high, 537.13 ft above NAVD of 1988, Apr. 8, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1200 microsiemens per centimeter, Feb. 6 and 7, 2000; Minimum, 380 microsiemens per centimeter, Feb. 18, 2000.

pH: Maximum, 8.2, Dec. 19-22, 1999, Jan. 3, and 4, 2000; Minimum, 6.7, Mar. 21, 2000.

WATER TEMPERATURE: Maximum, 27.2°C, Sept. 8, 2000; Minimum, 3.2°C, Feb. 8, 2000.

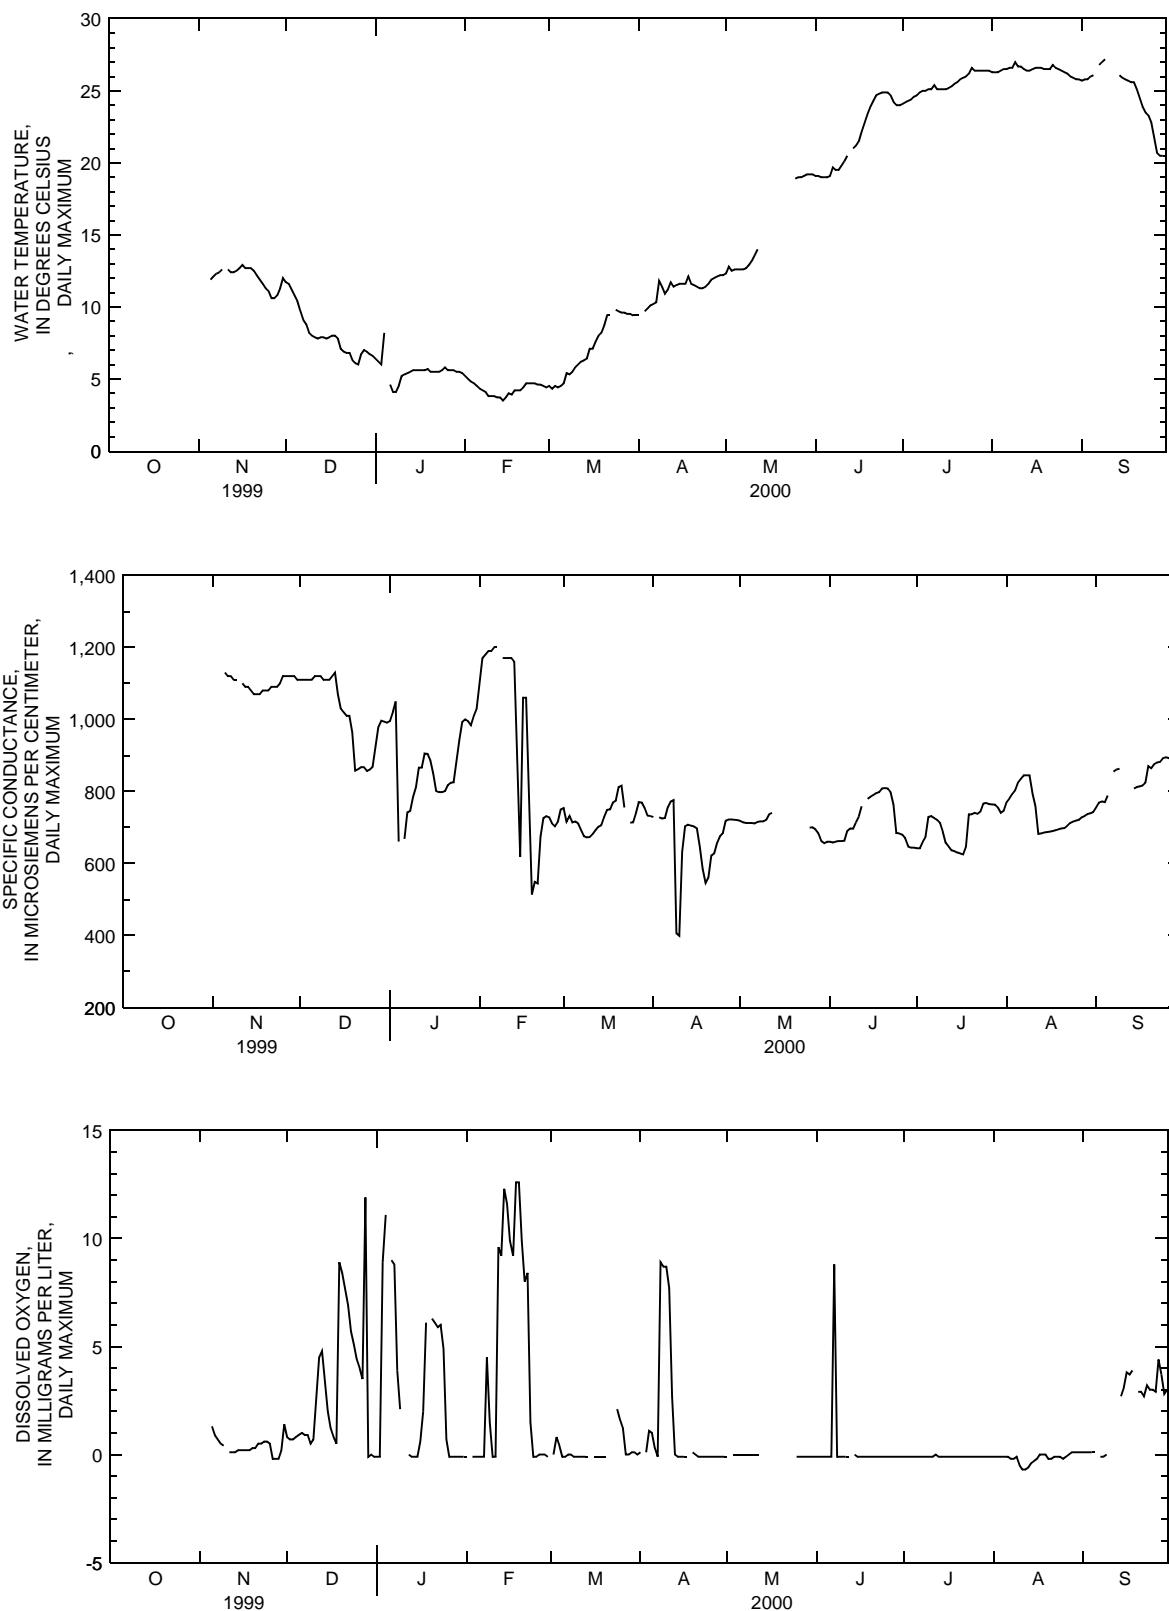

TURBIDITY: Maximum, 1200 NTU, Jan. 3, 4, Feb. 8, and Apr. 12, 2000; Minimum, -3.7 NTU, Aug. 6-8, 2000.

DISSOLVED OXYGEN: Maximum, 12.6 milligrams per liter, Feb. 18 and 19, 2000; Minimum, -0.8 milligram per liter, Aug. 11 and 12, 2000.

Water Data for Bolton Well Field

03274060 GREAT MIAMI RIVER NEAR FAIRFIELD, OHIO

LOCATION.—Latitude 39°19'03", longitude 84°36'22", Butler County, Hydrologic Unit 05080002, north of Miami River Road, northeast of Cincinnati Water Works, Bolton Plant, Fairfield, Ohio.

INSTRUMENTATION.—YSI Model 6600 data sonde with turbidity probe set for 30-minute records, ISCO water sampler and CR10 data recorder with water-stage gage.

DATUM.—Datum of gage is 530 ft above North American Vertical Datum of 1988 (NAVD of 1988).

REMARK.—This station is part of a flow path study designed to help model flow characteristics from the Great Miami River through the aquifer. Data collection began on Aug. 3, 1999.

PERIOD OF RECORD.—

WATER LEVEL ELEVATION: August 3, 1999 to current year

SPECIFIC CONDUCTANCE: August 3, 1999 to current year

pH: August 3, 1999 to current year

WATER TEMPERATURE: August 3, 1999 to current year

TURBIDITY: August 3, 1999 to current year

DISSOLVED OXYGEN: August 3, 1999 to current year

EXTREMES FOR PERIOD OF RECORD.—

WATER LEVEL ELEVATION: Minimum daily stage, 531.92 ft above NAVD of 1988, Sept. 17, 1999; Maximum daily stage, 545.95 ft above NAVD of 1988, Apr. 8, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,260 microsiemens per centimeter, Jan. 26 and 27, 2000; Minimum, 235 microsiemens per centimeter, June 21, 2000.

pH: Maximum, 9.2, Oct. 14, 1999; Minimum, 7.5, Jan. 4 and 5, 2000.

WATER TEMPERATURE: Maximum, 30.6°C, Sept. 2, 2000; Minimum, 0.5°C, Jan. 27, 2000.

TURBIDITY: Maximum, 1200 NTU, Jan. 3, 4, and Apr. 8, 2000; Minimum, 1.0 NTU, Feb. 27, 2000.

DISSOLVED OXYGEN: Maximum, 19.4 milligrams per liter, July 18, 2000; Minimum 0.1 milligram per liter, July 17, 2000.

EXTREMES FOR CURRENT YEAR.—

WATER LEVEL ELEVATION: Minimum daily stage, 532.03 ft above NAVD of 1988, Oct. 7, 1999; Maximum daily stage, 545.95 ft above NAVD of 1988, Apr. 8, 2000.

SPECIFIC CONDUCTANCE: Maximum, 1,260 microsiemens per centimeter, Jan. 26 and 27, 2000; Minimum, 235 microsiemens per centimeter, June 21, 2000.

pH: Maximum, 9.2, Oct. 14, 1999; Minimum, 7.5, Jan. 4 and 5, 2000.

WATER TEMPERATURE: Maximum, 30.6°C, Sept. 2, 2000; Minimum, 0.5°C, Jan. 27, 2000.

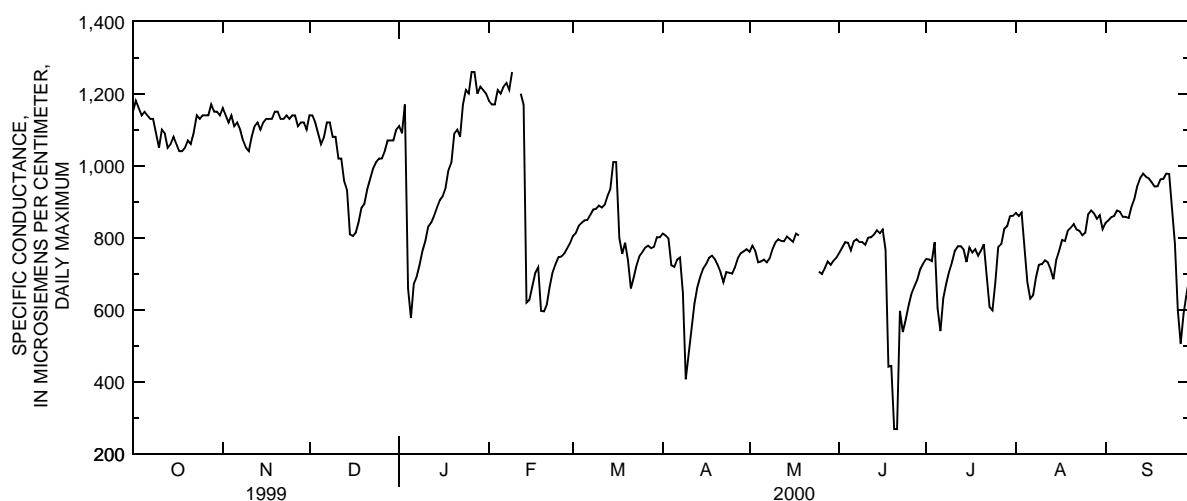

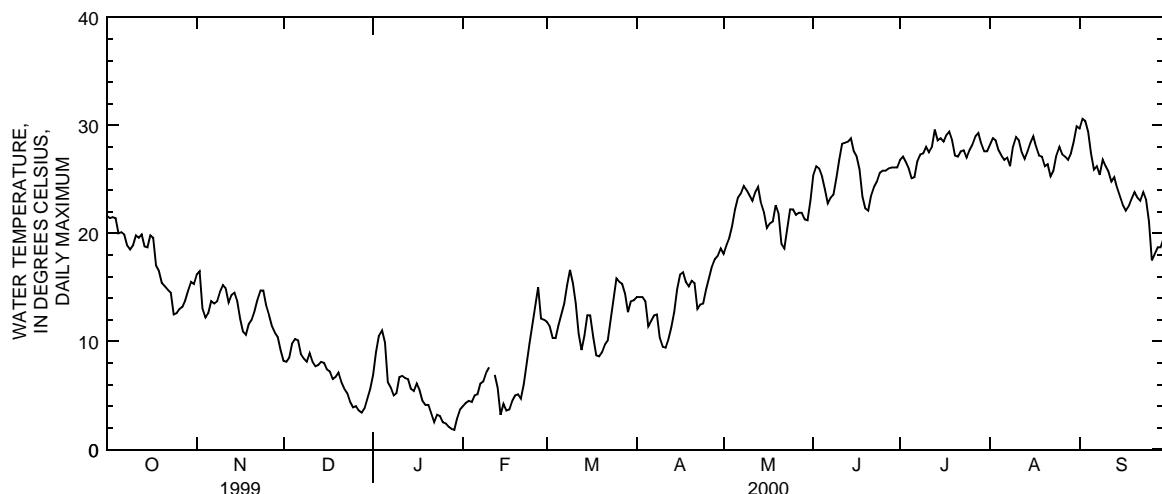

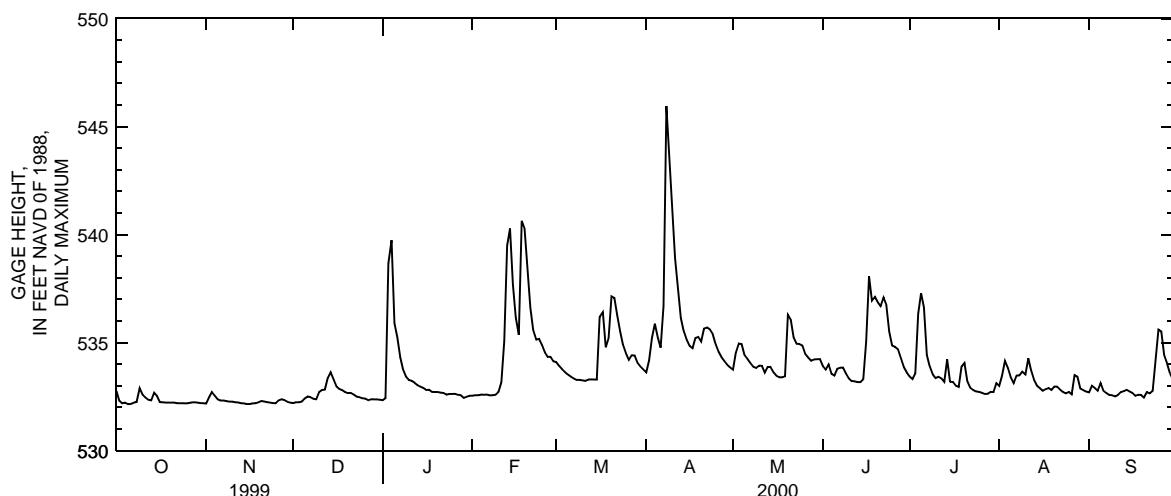

TURBIDITY: Maximum, 1200 NTU, Jan. 3, 4, and Apr. 8, 2000; Minimum, 1.0 NTU, Feb. 27, 2000.

DISSOLVED OXYGEN: Maximum, 19.4 milligrams per liter, July 18, 2000; Minimum 0.1 milligram per liter, July 17, 2000.

Ground-Water-Quality Data for Ohio Department of Natural Resources Wells

The following tables contain ground-water-quality data collected as part of a cooperative study with the Ohio Department of Natural Resources. Descriptions of the eight sample sites are specified below. Well construction data were obtained from ODNR station descriptions or from measurements made by U.S. Geological Survey personnel.

| Local number | Site Identifier | Latitude | Longitude | Altitude of land surface (feet) | Depth (feet) | Casing Diameter (inches) | County | Township |

**Effects of Combined-Sewer Overflows on Recreational Waters and
Aquatic Life of the Mahoning River and Tributaries in Youngstown, Ohio**

The data described in the following tables were collected as part of the Youngstown, Ohio, sewer-overflow project. The goal of this project is to develop an improved understanding of the effects of combined-sewer overflows on attainment of water-quality standards for both primary-contact recreation and the protection of aquatic life. In order to attain this goal, microbiological and chemical water-quality data of the Mahoning River and its tributaries were collected during two storm events. Water-quality data were collected from 14 sites; 8 sites along Mill Creek and tributaries, 5 sites along the Mahoning River and tributaries, and the Youngstown wastewater-treatment plant outfall. Continuous hydrologic data were collected at selected sites.

[mi², square miles]

| Station number | Station name | Drainage area (mi ²) |
|-----------------|--|----------------------------------|
| 03098000 | Mahoning River at Youngstown, Ohio | 898 |
| 03098406 | Mill Creek at Shields Road at Boardman, Ohio | 53.7 |

**Effects of Combined-Sewer Overflows on Recreational Waters and
Aquatic Life of the Mahoning River and Tributaries in Youngstown, Ohio**
03098406 MILL CREEK AT SHIELDS ROAD AT BOARDMAN, OHIO

LOCATION.—Latitude 41°02'41", longitude 80°41'00", Mahoning County, Hydrologic Unit 05030103, on right bank, upstream from Shields Road bridge at Boardman, and 400 ft upstream from Cranberry Creek.

DRAINAGE AREA.—53.7 mi².

PERIOD OF RECORD.—June 1999 to September 2000 (station discontinued).

GAGE.—Water-stage recorder. Altitude of gage is 1,040 ft above North American Vertical Datum of 1988 (NAVD of 1988), from the Global Positioning System.

REMARKS.—Records fair except for periods of estimated record, which are poor.

PROJECT DATA
Effects of Combined-Sewer Overflows on Recreational Waters and
Aquatic Life of the Mahoning River and Tributaries in Youngstown, Ohio
 03098500 MILL CREEK AT YOUNGSTOWN, OHIO

LOCATION.—Latitude 41°04'19", longitude 80°41'26", in T.2N., R.2W., Mahoning County, Hydrologic Unit 05030103, on right bank 600 ft upstream from suspension bridge in Mill Creek Park at Youngstown, 1 mi downstream from Newport Dam, and 2.5 mi upstream from mouth.

DRAINAGE AREA.—66.3 mi².

PERIOD OF RECORD.—October 1943 to September 1971, June 1999 to September 2000 (station discontinued). Prior to December 1943, monthly discharge only, published in WSP 1305.

REVISED RECORDS.—WSP 1907: Drainage area.

GAGE.—Water-stage recorder. Altitude of gage is 898.52 ft above National Geodetic Vertical Datum of 1929 (NGVD of 1929).

REMARKS.—Records fair except for periods of estimated record, which are poor. Flow regulated intermittently by Newport Dam.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood in March 1913 reached a discharge of 7,140 ft³/s at dam 1 mi downstream (computed by Mill Creek Park Association).

EXTREMES.—June 1 to Sept. 30, 1999. Maximum discharge, 254 ft³/s, July 29, gage height 1.88 ft; Minimum daily, 1.7 ft³/s, July 13.

PROJECT DATA
Effects of Combined-Sewer Overflows on Recreational Waters and
Aquatic Life of the Mahoning River and Tributaries in Youngstown, Ohio
03098513 MILL CREEK AT PRICE ROAD AT YOUNGSTOWN, OHIO

LOCATION.—Latitude 41°06'05", longitude 80°40'19", Mahoning County, Hydrologic Unit 05030103, on left bank wingwall of Lake Glacier Dam at Price Road, 300 ft upstream from confluence with Mahoning River in Youngstown.

DRAINAGE AREA.—78.4 mi².

PERIOD OF RECORD.—October 1999 to September 2000 (station discontinued).

GAGE.—Water-stage recorder. Altitude of gage is 846 ft above North America Vertical Datum of 1988 (NAVD of 1988), from Global Positioning System.

REMARKS.—Records good except for periods of estimated record, which are poor. Regulation by three low-head dams: Newport Lake, Lake Cohassat, and Glacier Lake.

**Effects of Combined-Sewer Overflows on Recreational Waters and
Aquatic Life of the Mahoning River and Tributaries in Youngstown, Ohio**
03098700 CRAB CREEK AT YOUNGSTOWN, OHIO

LOCATION.—Latitude 40°06'39", longitude 80°38'09", Mahoning County, Hydrologic Unit 05030102, on right bank upstream from State Route 62 overpass on Logan Avenue, 1.25 mi upstream from the confluence with the Mahoning River.

DRAINAGE AREA.—20.1 mi².

PERIOD OF RECORD.—April 1999 to September 2000 (station discontinued).

GAGE.—Water-stage recorder. Altitude of gage is 816 ft above North America Vertical Datum of 1988 (NAVD of 1988), from Global Positioning System.

REMARKS.—Records fair except for periods of estimated record, which are poor.

PROJECT DATA

**Effects of Combined-Sewer Overflows on Recreational Waters and
Aquatic Life of the Mahoning River and Tributaries in Youngstown, Ohio**
03099500 MAHONING RIVER AT LOWELLVILLE, OHIO

LOCATION.—Latitude 40°02'12", longitude 80°32'11", in T.1N., R.1.W., Mahoning County, Hydrologic Unit 05030103, on left bank 100 ft upstream from First Street bridge at Lowellville, 1 mi upstream from Ohio-Pennsylvania State line, and 3 mi downstream from Yellow Creek.

DRAINAGE AREA.—1,073 mi².

PERIOD OF RECORD.—October 1943 to September 1972, October 1973 to September 1991, April 1999 to September 2000 (station discontinued).

Prior to August 1943 monthly discharge only, published in WSP 1305.

REVISED RECORDS.—WSP 1955: 1946(M), 1952(M), 1955(M), 1956. WSP 1907: Drainage area.

GAGE.—Water-stage recorder. Altitude of gage is 796.84 ft above National Geodetic Vertical Datum of 1929 (NGVD of 1929). Prior to Oct. 26, 1944, nonrecording gage at site 300 ft downstream at same datum.

REMARKS.—Records good. Flow regulated by 5 flood control reservoirs at points 21 to 58 mi upstream and by reservoirs on Squaw Creek, 15 mi upstream, on Dry Run, 9 mi upstream, and on Yellow Creek, 5 mi upstream. Water-quality data collected at this site 1949 to 1973. U.S. Army Corps of Engineers satellite telemeter at station.

EXTREMES FOR PERIOD OF RECORD.—Maximum discharge 21,000 ft³/s Jan. 21, 1959, gage height, 14.43 ft; minimum daily, 155 ft³/s Feb. 5, 1944.

EXTREMES OUTSIDE PERIOD OF RECORD.—Flood in March 1913 reached a stage of 17.8 ft.

EXTREMES.—Apr. 1, 1999 to Sept. 30, 2000. Maximum discharge, 14,200 ft³/s, Apr. 8, 2000, gage height, 10.83 ft; minimum daily, 212 ft³/s, Nov. 19, 1999.

PROJECT DATA

Columbus Well Field, Southern Franklin County, Ohio

391

The following tables contain ground-water-level measurements from a network of wells in southern Franklin County. The data were collected as part of a cooperative study with the City of Columbus.

PROJECT DATA
Columbus Well Field, Southern Franklin County, Ohio

395037082581900. LOCAL NUMBER, FR-36

LOCATION.—Latitude 39°50'37", longitude 82°58'19", Hydrologic Unit 05060001. Owner: J.P. Sand and Gravel
AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation water well, diameter 4 in., depth 31 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 715 ft above sea level. Measuring point: Top of casing, 1.3 ft above land-surface datum.

PERIOD OF RECORD.—October 1974 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 10.03 ft below land-surface datum, Oct. 17, 1979; lowest measured, 21.69 ft below land-surface datum, Mar. 16, 1992.

WATER LEVEL,
IN FEET BELOW LAND-SURFACE DATUM
INSTANTANEOUS OBSERVATION

| DATE | WATER LEVEL |
|----------|-------------|
| 03/02/00 | 18.55 |

394927082595800. LOCAL NUMBER, FR-70

LOCATION.—Latitude 39°49'27", longitude 82°59'58", Hydrologic Unit 05060001. Owner: St. Joseph Cemetery.
AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation water well, depth 59 ft; 4-in. casing.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 705 ft above sea level. Measuring point: Top of concrete base, 0.35 ft above land-surface datum.

PERIOD OF RECORD.—April 1975 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 13.24 ft below land-surface datum, Mar. 18, 1991; lowest measured, 27.60 ft below land-surface datum, June 12, 1992.

WATER LEVEL,
IN FEET BELOW LAND-SURFACE DATUM
INSTANTANEOUS OBSERVATION

| DATE | WATER LEVEL |
|----------|-------------|
| 03/02/00 | 22.60 |

395217083002300. LOCAL NUMBER FR-72

LOCATION.—Latitude 39°52'17", longitude 83°00'23", Hydrologic Unit 05060001.

AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation water well, depth 34.6 ft, 3-in. casing.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 715 ft above sea level. Measuring point: Top of casing inside pit, 3.5 ft below land-surface datum.

PERIOD OF RECORD.—May 1975 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 23.01 ft below land-surface datum, June 27, 1990; lowest measured, dry on dates in 1992, 1995, 1996, 1999, and March 2 of this water year.

WATER LEVEL,
IN FEET BELOW LAND-SURFACE DATUM
INSTANTANEOUS OBSERVATION

| DATE | WATER LEVEL |

Columbus Well Field, Southern Franklin County, Ohio

395019083003300. LOCAL NUMBER, FR-104

LOCATION.—Latitude 39°50'19", longitude 83°00'33", Hydrologic Unit 05060001. Owner: City of Columbus.
AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation well, diameter 6 in., depth 79.3 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 683 ft above sea level. Measuring point: Top of casing, 3.89 ft above land-surface datum.

PERIOD OF RECORD.—December 1989 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 11.51 ft below land-surface datum, Mar. 17, 1995; lowest measured, 53.59 ft below land-surface datum, Dec. 11, 1991.

PROJECT DATA
Columbus Well Field, Southern Franklin County, Ohio

395039082585800. LOCAL NUMBER, FR-115

LOCATION.—Latitude 39°50'39", longitude 82°58'58", Hydrologic Unit 05060001, near Hamilton Meadows. Owner: City of Columbus.
AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation well, diameter 6 in., depth 116 ft.

INSTRUMENTATION.—Data logger, 60-minute record.

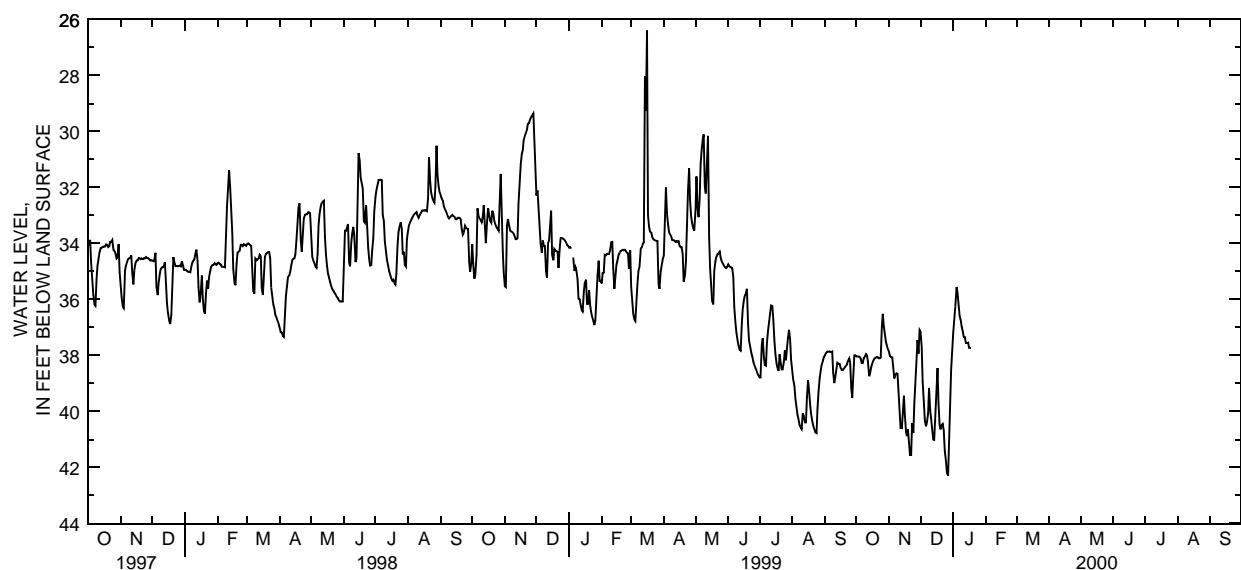

DATUM.—Elevation of land-surface datum is 721 ft above sea level. Measuring point: Floor of instrument shelter, 2.10 ft above land-surface datum.

PERIOD OF RECORD.—August 1982 to current year.

EXTREMES FOR PERIOD OF RECORD.—Maximum daily low, 48.15 ft below land-surface datum, Feb. 28 and 29, 1992; minimum daily low, 27.21 ft below land-surface datum, May 3, 1984.

AQUIFER.—Devonian limestone.

WELL CHARACTERISTICS.—Drilled domestic water well, diameter 4 in., depth 220 ft, cased to 175 ft.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 752 ft above sea level. Measuring point: Top of casing, 1.17 ft above land-surface datum.

PERIOD OF RECORD.—June 1979 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 66.17 ft below land-surface datum, June 25, 1979; lowest measured, 96.50 ft below land-surface datum, July 19, 1984.

PROJECT DATA
Columbus Well Field, Southern Franklin County, Ohio

401

394941083004400. LOCAL NUMBER, FR-275

LOCATION.—Latitude 39°49'41", longitude 83°00'44", Hydrologic Unit 05060001, near Shaderville. Owner: Franklin County.
AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation water well, depth 25 ft; 2-in. casing.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 680 ft above sea level. Measuring point: Top of steel protective casing, 5.00 ft above land-surface datum.

PERIOD OF RECORD.—April 1990 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 1.44 ft below land-surface datum, Mar. 26, 1993; lowest measured, 13.12 ft below land-surface datum, Apr. 18, 1991.

Columbus Well Field, Southern Franklin County, Ohio

395020083003406. LOCAL NUMBER FR-341

LOCATION.—Latitude 39°50'24", longitude 83°00'28", Hydrologic Unit 05060001. Owner: City of Columbus.
AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation water well, 4 in. diameter, 75 ft deep.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 683.43 ft above sea level. Measuring point: Top of PVC casing, 2.52 ft above land-surface datum.

PERIOD OF RECORD.—February 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 11.79 ft below land-surface datum, May 31, 1996; lowest measured, 32.39 ft below land-surface datum, Feb. 26, 1996.

395020083003407. LOCAL NUMBER FR-342

LOCATION.—Latitude 39°50'24", longitude 83°00'28", Hydrologic Unit 05060001. Owner: City of Columbus.
AQUIFER.—Devonian limestone.

WELL CHARACTERISTICS.—Drilled observation water well, 4 in. diameter, 123 ft deep.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 683 ft above sea level. Measuring point: Top of PVC casing, 2.50 ft above land-surface datum.

PERIOD OF RECORD.—February 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 11.86 ft below land-surface datum, Mar. 17, 1997; lowest measured, 27.02 ft below land-surface datum, Mar. 2, 2000.

395236083004201. LOCAL NUMBER FR-345

LOCATION.—Latitude 39°52'36", longitude 83°00'42", Hydrologic Unit 05060001. Owner: City of Columbus.
AQUIFER.—Sand and gravel of Quaternary age.

WELL CHARACTERISTICS.—Drilled observation water well, 4 in. diameter, 45 ft deep.

INSTRUMENTATION.—Periodic measurement with steel or electric tape by USGS personnel.

DATUM.—Elevation of land-surface datum is 688.90 ft above sea level. Measuring point: Top of PVC casing, 2.53 ft above land-surface datum.

PERIOD OF RECORD.—August 1996 to current year.

EXTREMES FOR PERIOD OF RECORD.—Highest water level measured, 20.25 ft below land-surface datum, Sept. 14, 1997; lowest measured, 25.52 ft below land-surface datum, Mar. 2, 2000.

PROJECT DATA

Bacteriological, Water-Quality, and Sediment-Quality Data at Ohio Beaches

Field studies were done during the recreational season of 2000 (May through September) at five Ohio Lake Erie public beaches and at one inland public beach. Most of the data listed below were collected by local agencies and compiled by the USGS to develop predictive *Escherichia coli* (*E. coli*) models. Water samples for *E. coli* and ancillary environmental and water-quality data were collected and analyzed by local agencies 4 or 5 days each week throughout the summer. In addition, special studies were conducted by the USGS to gather information on the storage of *E. coli* in sediments and sources of *E. coli* contamination of bathing waters; routine analyses of sediment and water quality from these special studies are also listed below.

Bacteriological, Water-Quality, and Sediment-Quality Data at Ohio Beaches

WATER-QUALITY RECORDS

The following tables list the results of bacteriological, water-quality, and physical measurements of water samples collected in the nearshore zone of three Lake Erie beaches in Cuyahoga County, Ohio, two Lake Erie beaches in Lake County, Ohio, and one inland reservoir beach in Trumbull County, Ohio during May through September 2000. Samples were collected as part of a study to develop a predictive model for *Escherichia coli* in recreational waters and investigate the storage of *E. coli* in sediments.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 200

{(00028), USGS National Water Information System parameter code; $\mu\text{S}/\text{cm}$, microsiemens per centimeter; deg C, degrees Celsius; NTU, nephelometric turbidity units; col/100 mL, colonies per 100 milliliters; mf, membrane filtration; -- no data; k, value is estimated from a non-ideal colony count; e, estimated; <, concentration or value reported is less than that indicated; a, average value}

Bacteriological, Water-Quality, and Sediment-Quality Data at Ohio Beaches

WATER-QUALITY RECORDS—CONTINUED

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000—Continued

[(00028), USGS National Water Information System parameter code; $\mu\text{S}/\text{cm}$, microsiemens per centimeter; deg C, degrees Celsius; NTU, nephelometric turbidity units; col/100 mL, colonies per 100 milliliters; mf, membrane filtration; -- no data; k, value is estimated from a non-ideal colony count; e, estimated; <, concentration or value reported is less than that indicated; a, average value]

| Date | Time | Agency analyzing sample (00028) | Agency collecting sample (00027) | Specific conductance, field ($\mu\text{S}/\text{cm}$) (00095) | Air temperature (deg C) (00020) | Water temperature (deg C) (00010) | Depth, bottom at sample location (feet) (81903) | Turbidity (NTU) (00076) | E. coli, ONPG-MUG, auto analysis (col/100 mL) (50468) | E. coli, water, MTEC, mf, total (col/100 mL) (31633) | Enterococci, water, mEl, mf, 24 hour (col/100 mL) (90909) |

PROJECT DATA
Bacteriological, Water-Quality, and Sediment-Quality Data at Ohio Beaches

SEDIMENT-QUALITY RECORDS

The following tables list the results of bacteriological, sediment-quality, and physical measurements of sediment samples collected in the interstitial zone of three Lake Erie beaches in Cuyahoga County, Ohio, and one inland reservoir beach in Trumbull County, Ohio during May through September 2000. Samples were collected as part of a study to develop a predictive model for *Escherichia coli* in recreational waters and investigate the storage of *E. coli* in sediments.

SEDIMENT-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

[(00028), USGS National Water Information System parameter code; deg C, degrees Celsius; bm, bottom material; ws, wet sieved; mm, millimeters; dw, dry weight; rec, recovered; g/kg, grams per kilograms; mf, membrane filtration method for *E. coli*; col/g, colonies per gram; e, estimated]

| Date | Time | Agency analyzing sample (00028) | Agency collecting sample (00027) | Air temperature (deg C) (00020) | Carbon, inorganic, sediment, bm ws, 2mm dw, rec (g/kg) (49270) | Carbon, organic, sediment, bm ws, 2mm dw, rec (g/kg) (49271) | Carbon, organic plus inorganic, sediment, bm ws, 2mm dw, rec (g/kg) (49272) | <i>E. coli</i> , sediment, MTEC, mf (col/g) (50466) |

PROJECT DATA

Characterization of Microbial Water Quality in Relation to Water-Contact Recreation, Cuyahoga River, Cuyahoga Valley National Park, Ohio

The following tables list the results of microbiological, chemical, and physical measurements collected at five locations in the Cuyahoga River in Summit and Cuyahoga Counties, Ohio. Samples were collected and analyzed as part of a study to modify existing USGS models to generate forecasts of instream bacterial concentrations. The data and model results will be used to characterize the occurrence, distribution, and public health significance of microbiological constituents that may contaminate the river during runoff.

CONVERSION FACTORS AND VERTICAL DATUM

| Multiply | By | To obtain |
|--|------------------------|------------------------|
| <i>Length</i> | | |
| inch (in.) | 2.54×10^1 | millimeter |
| foot (ft) | 2.54×10^{-2} | meter |
| mile (mi) | 3.048×10^{-1} | meter |
| | 1.609×10^0 | kilometer |
| <i>Area</i> | | |
| acre | 4.047×10^3 | square meter |
| | 4.047×10^{-1} | square hectometer |
| | 4.047×10^{-3} | square kilometer |
| square mile (mi^2) | 2.590×10^0 | square kilometer |
| <i>Volume</i> | | |
| gallon (gal) | 3.785×10^0 | liter |
| | 3.785×10^0 | cubic decimeter |
| | 3.785×10^{-3} | cubic meter |
| million gallons (Mgal) | 3.785×10^3 | cubic meter |
| | 3.785×10^{-3} | cubic hectometer |
| cubic foot (ft^3) | 2.832×10^1 | cubic decimeter |
| | 2.832×10^{-2} | cubic meter |
| cubic-foot-per-second day [$(\text{ft}^3/\text{s}) \text{ d}$] | 2.447×10^3 | cubic meter |
| | 2.447×10^{-3} | cubic hectometer |
| acre-foot (acre-ft) | 1.233×10^3 | cubic meter |
| | 1.233×10^{-3} | cubic hectometer |
| | 1.233×10^{-6} | cubic kilometer |
| <i>Flow</i> | | |
| cubic foot per second (ft^3/s) | 2.832×10^1 | liter per second |
| second | 2.832×10^1 | cubic decimeter per |
| gallon per minute (gal/min) | 2.832×10^{-2} | cubic meter per second |
| second | 6.309×10^{-2} | liter per second |
| | 6.309×10^{-2} | cubic decimeter per |
| million gallons per day (Mgal/d) | 6.309×10^{-5} | cubic meter per second |
| second | 4.381×10^1 | cubic decimeter per |
| | 4.381×10^{-2} | cubic meter per second |
| <i>Mass</i> | | |
| ton (short) | 9.072×10^{-1} | megagram or metric ton |

Sea level: In this report “sea level” refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929)—a geodetic datum derived from a general adjustment for the first-order level nets of both the United States and Canada, formerly called Sea Level Datum of 1929.
